Geomechanics and Geotechnics of Particulate Media Masayuki Hyodo, Hidekazu Murata, Yukio Nakata, 2017-12-14
Microscopic re examination of geomaterials consisting of aggregates can shed light on macroscopic behaviour including compressibility anisotropy yielding creep cyclic liquefaction and shear rupture As a result of this process of examination new methods of material characterization emerge leading to a greater degree of accuracy in the specification of new constitutive models with physically meaningful parameters The impetus behind this development is an increasing awareness on sustainability leading to the more efficient use of recycled materials for geotechnical applications The characteristics of recycled materials such as compressibility and self hardening may differ significantly from those of natural materials and it is crucial that evaluation is made from a specifically particulate perspective *Environmental Mineralogy* David J. Vaughan, Roy A. Wogelius, 2000 *Flow Rates Past Vertical Groundwater Cut-off Walls* Choosak Tachavises, 1998
