High Speed, Low

Driving Voltage Vertical Cavity Germanium-silicon Modulators for Optical Interconnect Yiwen Rong,2010

Information processing requires interconnects to carry information from one place to another Optical interconnects between electronics systems have attracted significant attention and development for a number of years because optical links have demonstrated potential advantages for high speed low power and interference immunity With increasing system speed and greater bandwidth requirements the distance over which optical communication is useful has continually decreased to chip to chip and on chip levels Monolithic integration of photonics and electronics will significantly reduce the cost of optical components and further combine the functionalities of chips on the same or different boards or systems Modulators are one of the fundamental building blocks for optical interconnects Previous work demonstrated modulators based upon the quantum confined Stark effect QCSE in SiGe p i n devices with strained Ge SiGe multi quantum well MQW structures in the i region While the previous work demonstrated the effect it did not examine the high speed aspects of the device which is the focus of this dissertation High speed modulation and low driving voltage are the keys for the device s practical use At lower optical intensity operation the ultimate limitation in speed will be the RC time constant of the device itself At high optical intensity the large number of photo generated carriers in the MQW region will limit the performance of the device through photo carrier related voltage drop and exciton saturation In previous work the devices consist of MQWs configured as p i n diodes The electric field induced absorption change by QCSE modulates the optical transmission of the device The focus of this thesis is the optimization of MQW material deposition minimization of the parasitic capacitance of the probe pads for high speed low voltage and high contrast ratio operation The design fabrication and high speed characterization of devices of different sizes with different bias voltages are presented The device fabrication is based on processes for standard silicon electronics and is suitable for mass production This research will enable efficient transceivers to be monolithically integrated with silicon chips for high speed optical interconnects We demonstrated a modulator with an eye diagram of 3 125GHz a small driving voltage of 2 5V and an f3dB bandwidth greater than 30GHz Carrier dynamics under ultra fast laser excitation and high speed photocurrent response are also investigated
