Genomic Potential Of Differentiated Cells:

Genomic Potential of Differentiated Cells M. A. DiBerardino, 1997-01 Few aspects of American military history have been as vigorously debated as Harry Truman's decision to use atomic bombs against Japan In this carefully crafted volume Michael Kort describes the wartime circumstances and thinking that form the context for the decision to use these weapons surveys the major debates related to that decision and provides a comprehensive collection of key primary source documents that illuminate the behavior of the United States and Japan during the closing days of World War II Kort opens with a summary of the debate over Hiroshima as it has evolved since 1945 He then provides a historical overview of the events in question beginning with the decision and program to build the atomic bomb Detailing the sequence of events leading to Japan's surrender he revisits the decisive battles of the Pacific War and the motivations of American and Japanese leaders Finally Kort examines ten key issues in the discussion of Hiroshima and guides readers to relevant primary source documents scholarly books and articles

Genomic Adaptability in Somatic Cell Specialization Marie A. DiBerardino, Laurence D. Etkin, 2012-12-06 I am pleased to include this book as Volume 6 of Developmental Biology A Comprehensive Synthesis It has been edited by two of the foremost investigators in the study of genomic adaptability I owe a special debt of gratitude to Dr Marie A DiBerardino who developed the concept of the volume Dr DiBerardino is also a very active member of the editorial board for this series Much of the success of this series is due to her valuable advice This series was established to create comprehensive treatises on specific topics in developmental biology Such volumes serve a useful role in developmental biology since it is a very diverse field that receives contributions from a wide variety of disciplines This series is a meeting ground for the various practitioners of this science facilitating an integration of heterogeneous information on specific topics Each volume is intended to provide the conceptual basis for a comprehensive understanding of its topic as well as analysis of the key experiments upon which that understanding is based The specialist in any aspect of developmental biology should understand the experimental background of the field and be able to place that body of information in context to ascertain where additional research would be fruitful At that point the creative process generates new experiments This series is intended to be a vital link in that process of learning and discovery

Germ Line — Soma Differentiation W. Hennig, 2013-06-05 One of the oldest problems in developmental biology is the differentiation between germ line and somatic cells The continuity of germ line cells between subsequent generations of multicellular organisms was first suggested by Owen and later elaborated by A Weismann to his famous germ line theory His additional assumption that cellular differentiation was based on a differential representation of the genetic material in somatic cells was soon disproved In some apparently exceptional cases however such differences in the genetic material between germ line and somatic cells were discovered The best known example is the nematode *Ascaris* Boveri discovered and studied the fundamental differences in the karyotypes of germ line and soma of *Parascaris equorum* Later similar situations were found in some other organisms However in particular the work of Spemann demonstrated that cellular differentiation in general is not accompanied by fundamental changes of the genetic material Subsequently the relatively few examples of germ line soma differences achieved by chromatin elimination processes have been considered as a curiosity Experimental studies have been essentially restricted to *Ascaris* species and to the pioneering cytological studies of chromatin elimination by S Beermann Despite the large proportions of the genome involved in chromatin elimination our knowledge of this process is still very restricted In particular the biological meaning of this differentiation process is entirely obscure In this context one must however consider that also for the majority of DNA sequences in eukaryotic genomes the biological relevance is unclear

Genetic Mosaics and Cell Differentiation W. J. Gehring, 2013-06-29 The relationship of cell lineage and differentiation is one of the most intriguing problems in developmental biology In most higher organisms the analysis of the cell lineage has to rely on indirect methods Only in the most suitable systems like the nematodes can the pattern of cell division be determined by direct observation under the microscope In cases where this is not possible the fate of the cells has to be examined by using cell markers Most suitable for this purpose are genetic markers provided that they do not interfere with the developmental pathway to be studied However suitable genetic markers and techniques for generating genetic mosaics are available in a few organisms only Therefore this

volume is largely concerned with *Drosophila* and the mouse which have been studied most extensively In 1929 STURTEVANT introduced the analysis of gynandromorphs into developmental genetics However this important contribution remained largely unnoticed until the late sixties when the potential of this technique for determining embryonic fate maps and the number of primordial cells was exploited and the methodology extended to the mapping of mutational foci Mitotic recombination was demonstrated by STER
