Lake, British Geological Survey, 1986 **The Early Middle Pleistocene in Europe** Charles Turner, 2020-08-26 These papers show how new research in the classic areas and Germany but particularly in Eastern Europe is radically altering views of the stratigraphy and palaeocology of the early middle Pleistocene period showing that major glaciations did not begin only in the late middle Pleistocene **A revised correlation of Tertiary rocks in the British Isles and adjacent areas of NW Europe** C. King, 2016-01-05 This Special Report comprehensively describes the stratigraphy and correlation of the Tertiary Paleogene Neogene rocks of NW Europe and the adjacent Atlantic Ocean and is the summation of fifty years of research on Tertiary sediments by Chris King His book is essential reading for all geologists who deal with Tertiary rocks across NW Europe including those in the petroleum industry and geotechnical services as well as academic stratigraphers and palaeontologists Introductory sections on chronostratigraphy biostratigraphy and other methods of dating and correlation are followed by a regional summary of Tertiary sedimentary basins and their framework and an introduction to Tertiary igneous rocks The third and largest segment comprises the regional stratigraphic summaries Regions covered are the North Sea Basin onshore areas of southern England and the eastern English Channel area the North Atlantic margins including non marine basins in the Irish Sea and elsewhere and the Paleogene igneous rocks of Scotland *Dams 2000* British Dam Society. Lyons, Arthur H. Brownlow, 1976-01-01 **Quaternary of the Thames** D.R. Bridgland, 2012-12-06 The principal aim of this volume is to provide descriptions of Sites of Special Scientific Interest selected as part of the Geological Conservation Review that yield evidence for the Pleistocene history of the River Thames and its tributaries Although defined thematically the volume covers all Pleistocene GCR sites in the Thames valley A number of sites in southern East Anglia are also included because they provide important evidence bearing on the history of the

Thames system The justification for a GCR volume devoted to the Thames lies in the special importance of the river in the British Quaternary The volume is concerned with the history of Britain over approximately the last two million years of geological time during the repeated glacial phases of the Quaternary Ice Age and the warmer intervals between them Many such climatic fluctuations are recorded in the deposits of the Thames which can be shown to have existed as the predominant west to east drainage line in south eastern England throughout the Pleistocene The Thames has left a detailed record of its earlier presence in the form of deposits which comprise fluviially aggraded floodplain sediments predominantly gravels preserved on the valley sides where they form geomorphological terrace features The oldest deposits are at the highest levels forming a terrace staircase that records successive stages in the evolution of the valley
