Genetic Mosaics and Other Essays Curt Stern, 1969-04-30 *Genetic Mosaics and Cell Differentiation* W. J. Gehring, 2013-06-29 The relationship of cell lineage and differentiation is one of the most intriguing problems in developmental biology In most higher organisms the analysis of the cell lineage has to rely on indirect methods Only in the most suitable systems like the nematodes can the pattern of cell division be determined by direct observation under the microscope In cases where this is not possible the fate of the cells has to be examined by using cell markers Most suitable for this purpose are genetic markers provided that they do not interfere with the developmental pathway to be studied However suitable genetic markers and techniques for generating genetic mosaics are available in a few organisms only Therefore this volume is largely concerned with *Drosophila* and the mouse which have been studied most extensively In 1929 STURTEVANT introduced the analysis of gynandromorphs into developmental genetics However this important contribution remained largely unnoticed until the late sixties when the potential of this technique for determining embryonic fate maps and the number of primordial cells was exploited and the methodology extended to the mapping of mutational foci Mitotic recombination was demonstrated by STURTEVANT *Genetic Mosaicism* János Szabad, 2021-06-17 The presence of green and yellow ornamental plants around us dark spots on our skin people with brown and blue mosaic irises and white spotted dogs and horses are all well known phenomena of life and are recognisable genetic mosaics Although such genetics mosaics live with us and in fact we are all a genetic mosaics little is known about the genetic bases of their origin This book provides a general overview of the mechanisms that lead to the formation of different types of mosaics listing an ample collection of examples to illustrate the impact of the genetic mosaics on our life The book will appeal to the reader interested in understanding the relationship between genetic events and mosaicism especially undergraduate and graduate students and medical doctors as well as experts engaged in horticulture and animal breeding *Genetic Theory and Analysis* Danny E. Miller, Angela L. Miller, R. Scott Hawley, 2023-07-25 **GENETIC THEORY AND ANALYSIS** Understand and apply what drives change of characteristic genetic traits and heredity Genetics is the study of how traits are passed from parents to their offspring and how the variation in those traits affects the development and health of the organism Investigating how these traits affect the organism involves a diverse set of approaches and tools including genetic screens DNA and RNA sequencing mapping and methods to understand the structure and function of proteins Thus there is a need for a textbook that provides a broad overview of these methods *Genetic Theory and Analysis* meets this need by describing key approaches and methods in genetic analysis through a historical lens Focusing on the five basic principles underlying the field mutation complementation recombination segregation and regulation it identifies the full suite of tests and methodologies available to the geneticist in an age of flourishing genetic and genomic research This second edition of the text has been updated to reflect recent advances and increase accessibility to advanced undergraduate students *Genetic Theory and Analysis* 2nd edition readers

will also find Detailed treatment of subjects including mutagenesis meiosis complementation suppression and more Updated discussion of epistasis mosaic analysis RNAi genome sequencing and more Appendices discussing model organisms genetic fine structure analysis and tetrad analysis Genetic Theory and Analysis is ideal for both graduate students and advanced undergraduates undertaking courses in genetics genetic engineering and computational biology **For Better or For Worse? Collaborative Couples in the Sciences** Annette Lykknes, Donald L. Opitz, Brigitte Van Tiggelen, 2012-06-05 In this volume a distinguished set of international scholars examine the nature of collaboration between life partners in the sciences with particular attention to the ways in which personal and professional dynamics can foster or inhibit scientific practice Breaking from traditional gender analyses which focus on divisions of labor and the assignment of credit the studies scrutinize collaboration as a variable process between partners living in the nineteenth and twentieth centuries who were married and divorced heterosexual and homosexual aristocratic and working class and politically right and left The contributors analyze cases shaped by their particular geographical locations ranging from retreat settings like the English countryside and Woods Hole Massachusetts to university laboratories and urban centers in Berlin Stockholm Geneva and London The volume demonstrates how the terms and meanings of collaboration variably shaped by disciplinary imperatives cultural mores and the agency of the collaborators themselves illuminate critical intellectual and institutional developments in the modern sciences Cats Are Not Peas Laura Gould, 2008-02-08 The Vets Turn Pale George a male calico was a genetic anomaly a manifestation of something that isn't supposed to happen a creature so rare that even most veterinarians have never seen one His curious existence sparked Laura Gould's long search through the archives of genetics to unearth the charming and valiant roles played by early cat Biological Processes in Living Systems C. H. Waddington, 2017-09-08 Biological Processes in Living Systems is the fourth and final volume of the Toward a Theoretical Biology series It contains essays that deal in detail with particular biological processes morphogenesis of pattern the development of neuronal networks evolutionary processes and others The main thrust of this volume brings relevance to the general underlying nature of living systems Faced with trying to understand how the complexity of molecular microstates leads to the relative simplicity of phenome structures Waddington on behalf of his colleagues stresses on the structure of language as a paradigm for a theory of general biology This is language in an imperative mood a set of symbols organized by some form of generative grammar making possible the conveyance of commands for action to produce effects on the surroundings of the emitting and the receiving entities Biology he writes is concerned with algorithm and program Among the contributions in this volume are The Riemann Hypothesis Catastrophe and van der Waals Equation David H Fowler Differential Equations for the Heartbeat and Nerve Impulse E Christopher Zeeman Structuralism and Biology Rene Thom The Concept of Positional Information and Pattern Formation Lewis Wolpert Pattern Formation in Fibroblast Cultures Tom Elsdale Form and Information C H Waddington Organizational Principles for Theoretical Neurophysiology Michael A Arbib Stochastic Models of Neuroelectric
