

GENETICS

A. Organismal Reproduction

- One of the most important requisites of all life, from the earliest life forms to present-day organisms, is reproduction.
- Characteristics or traits of organisms must be passed on during reproduction

B. Cellular Reproduction

- Life as we know it is based on the cell, the basic unit of life
- Cell theory states all organisms are made up of cells and come from cells

C. DOMA

 DNA (gloosynboguchic gold) is the molecule of inheritance in ALL collision forms of life.

D. Chromosopours

- Eukaryetic cells process macker DNA with structural and easy matic process, forming thrematic, which is visible as chromosomers during parts of the cell cycle.
- 2. Peukaryotic cells posseus simpler DNA.
- Sexually reproducing organisms typically have pairs of homologous ehromosomes (look-alike chromosomes)

IL RINA

- RNA (gibequefele gold) is found in several forms, most of which are used in protein synthesis
- RNA is the molecule of inheritance in some viruses, which are not cell-hand life forms

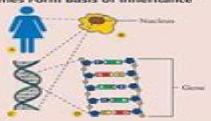

F. Gener

- 1. Functional unit of inheritance and basis for most traits
- Located at lisel, or specific positions, on DNA; to be preserved and transmitted
- Control biological processes through production of proteins and RNA

Basic Concepts

- Generappe refers to the generale composition of the organism
- Phenotype refers to the abservable inherital swits (e.g., physical, behavioral, physiological characteristics); based on the inherited genotype

Genes Form Basis of Inheritance

G. Ploudy

- Homelogous chromosome pairs have the same loci, thus penes
- When both chromosomes are present, for each gene there are two representatives; this is represented by the symbol 2n or diplated condition.
- When only half of each homologous chromosome pair is present, such as in gametee, this is represented by the symbol n or haploid

HL Alliches

 Altomate forms of the same gone that could occupy the same locus (e.g., brown versus blue eye color)

- Humologous chromosomes process two representatives of each gene (i.e., 2n)
- Homorygous refers to the diploid condition where hoth allefor of the percept are identical to p. A.A. axi
- Heteroxygous refers to the diploid condition where both alleles of the generype are different (i.e., As)
- Dominant affects form a phenotypic expression regardless of the other affect on the matched chromosome of the homologue (e.g., "AA" or "Aa" genotypes will both express the phenotype designated by the "A" affect;
- 6. Registring affletes fail to form a phenotypic expression unless the other affels on the matched chromosome is also recessive (e.g., "na" genetype is the only may for the phenotype designated by the "a" affels to be expressed, assuming no other gene pairs influence inheritance [see epistasis discussion in Gene Action Categories, page 2])
- Additional types of allelic interactions will be discussed in subsequent sections
- Determining gamete types: Assuming there are no mutations, affelies personn in gametes are determined by the diploid genetypes of parents.
 - a. For homozygous genetypes, Auginizi generics will be identical for the given traits (i.e., AA individual sould produce "A" gametes only; AAbbindividual would produce "Ab" gametes only;
 - b. For hoterary goan genotypes, Augilial gamento will be aligned for the given traits (i.e., An individual resuld produce "A. B. "I gamento: Audib individual would produce "A.B. Ab, aB, ab" gamento: assuming two traits are unlinked [see Independent Assortment & Iblig brid Crosses, page 23)

Mendelian Genetics

A. Greece Mendel (1822-1884).

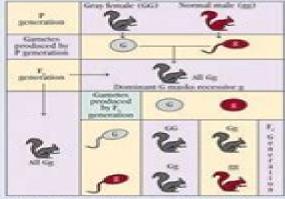

- An Austrian monk who, through his love and interest in nature, developed the basic ideas of genetics long before chromosomes and genes (i.e., molecular biology) were discovered.
 - a. He developed his ideas by studying plants; in particular, his most famous work involved courses with pea plant varieties
- His results and interpretations contrasted with a prevailing (as that time) theme of inhoritance called "Mending"—the concept that inherited traits mixed to create a composite characteristic in offspring

B. Mendel's Genetics Laws

- Segregation of Alternate Factors & Monohybrid Crosses
 - a. Specifically, Mendel discovered that with certain traits, there were individual plants which, if only crossed with other plants just like them, would almost always produce the exact same phenotype.

- i. These individuals were called true-breeders
- ii. We now call this condition homozygous
- b. He also found that some individuals with similar appearance, when crossed, would not have all offigeing of the same kind.
- i. We now call this condition between goes
- Mendel decided to systematically do single-trait crosses to determine the causes for the previously stated observations.
- d. Specifically, a parental generation (P) initiated these experimental crosses by using two truebreeding pea plants for opposite phenotypes (e.g., purple versus white flowers)
- Offspring from this cross (F₁) all showed only one of the traits (e.g., purple flowers), and this trait was called the dominant trait
- f. Traits from the P generation "did not bland" in these F₁ individuals
- g. Fr individuals, the hybrids, were cross-politicated the monological cross—to produce Fr individuals.
- b. V_n of the F₂ individuals expressed the dominant trait, while V_n expressed the trait of the other P parent (e.g., white) that had not been expressed in the F₁ potention—this latter trait was the recessive form.
- The expected phenogytic ratio of the F₂ individuals in monohybrid crosses would be 3:1
- The expected genergyte ruttle of the F₂ individuals in monoleybrid crosses would be 2:1:1
- k. The diagram at right, called a Punnett square, namenarizes results of a single-test cross similar to those done by Mendel on pea plants and other organistis;

Mendel's 1st Law: Segregation of Alternate Factors

- Mendel concluded there had to be some physical entities or "factors" passed on by each parent of a cross
 - i. We now know these to be gones.
 - He also concluded that these factors came in pairs, which then became impaired (in the production of gametra, which occurs during melosis) and recombined during fertilization
- The two P generation individuals had the factors in alternate forms called alleles (e.g., purple versus white flowers)
