Fernandez, Monique Dupuis, 2023-08-28 Pork is the most widely produced meat in the world To cover the demands of a fast growing population new scientific knowledge in genetics physiology and nutrition is generated which contributes in a general increase of production performance Production systems can be improved by constructing models which help to optimise use of the means of production and intensify production In some regions where production intensity is high concerns about environmental pollution are increasingly becoming a limiting factor Consumers and with them the retailer organisations are voicing serious concerns about the production systems and especially the use of feed additives In the context of the above the question of the quality of pork becomes a relevant issue A general view can only be obtained by taking all factors into consideration The diverse aspects of pork quality were covered in the session on Quality of Meat and Fat as Affected by Genetics and Nutrition at the 50th annual meeting of the EAAP in Zurich This publication presents the review presentations which give an overview from the different perspectives of meat quality and its use in human nutrition genetics physiology animal nutrition meat consumption and human health and consumer concerns In addition 38 short communications provide up to date knowledge on the subject of quality from a European perspective The Genetics of the Pig.
