Eigenvalues Of The Laplacian For Hecke Triangle Groups:

Eigenvalues of the Laplacian for Hecke Triangle Groups Dennis A. Hejhal, 1992 Paper I is concerned with computational aspects of the Selberg trace formalism considering the usual type of eigenfunction and including an analysis of pseudo cusp forms and their residual effects Paper II examines the modular group $\mathrm{PSL}(2, \mathbb{Z})$ as such groups have both a discrete and continuous spectrum This paper only examines the discrete side of the spectrum **Emerging Applications**

of Number Theory Dennis A. Hejhal, Joel Friedman, Martin C. Gutzwiller, Andrew M. Odlyzko, 2012-12-06 Most people tend to view number theory as the very paradigm of pure mathematics With the advent of computers however number theory has been finding an increasing number of applications in practical settings such as in cryptography random number generation coding theory and even concert hall acoustics Yet other applications are still emerging providing number theorists with some major new areas of opportunity The 1996 IMA summer program on Emerging Applications of Number Theory was aimed at stimulating further work with some of these newest and most attractive applications Concentration was on number theory's recent links with a wide phenomena in quantum mechanics more specifically quantum chaos and b graph theory especially expander graphs and related spectral theory This volume contains the contributed papers from that meeting and will be of interest to anyone intrigued by novel applications of modern number theoretical techniques *Computations with Modular*

the theory of hypergeometric functions defined on domains of positivity Most of the scientific areas in which these functions are applied include analytic number theory combinatorics harmonic analysis random walks representation theory and mathematical physics are represented here This volume is based largely on lectures presented at a Special Session at the AMS meeting in Tampa Florida in March 1991 which was devoted to hypergeometric functions of matrix argument and to fostering communication among representatives of the diverse scientific areas in which these functions are utilized Accessible to graduate students and others seeking an introduction to the state of the art in this area this book is a suitable text for advanced graduate seminar courses for it contains many open problems

Arithmetic Groups and Their

Generalizations Lizhen Ji, 2008 In one guise or another many mathematicians are familiar with certain arithmetic groups such as \mathbf{Z} or $\mathrm{SL}_n(\mathbf{Z})$ Yet many applications of arithmetic groups and many connections to other subjects within mathematics are less well known Indeed arithmetic groups admit many natural and important generalizations The purpose of this expository book is to explain through some brief and informal comments and extensive references what arithmetic groups and their generalizations are why they are important to study and how they can be understood and applied to many fields such as analysis geometry topology number theory representation theory and algebraic geometry It is hoped that such an overview will shed a light on the important role played by arithmetic groups in modern mathematics Titles in this series are co published with International Press Cambridge MA Table of Contents Introduction General comments on references Examples of basic arithmetic groups General arithmetic subgroups and locally symmetric spaces Discrete subgroups of Lie groups and arithmeticity of lattices in Lie groups Different completions of \mathbb{Q} and S arithmetic groups over number fields Global fields and S arithmetic groups over function fields Finiteness properties of arithmetic and S arithmetic groups Symmetric spaces Bruhat Tits buildings and their arithmetic quotients Compactifications of locally symmetric spaces Rigidity of locally symmetric spaces Automorphic forms and automorphic representations for general arithmetic groups Cohomology of arithmetic groups K groups of rings of integers and K groups of group rings Locally homogeneous manifolds and period domains Non cofinite discrete groups geometrically finite groups Large scale geometry of discrete groups Tree lattices Hyperbolic groups Mapping class groups and outer automorphism groups of free groups Outer automorphism group of free groups and the outer spaces References Index Review from Mathematical Reviews the author deserves credit for having done the tremendous job of encompassing every aspect of arithmetic groups visible in today's mathematics in a systematic manner the book should be an important guide for some time to come AMSIP 43

Invariant Subsemigroups of Lie Groups Karl-Hermann Neeb, 1993 First we investigate the structure of Lie algebras with invariant cones and give a characterization of those Lie algebras containing pointed and generating invariant cones Then we study the global structure of invariant Lie semigroups and how far Lie's third theorem remains true for invariant cones and Lie semigroups

Imbeddings of Three-Manifold Groups Francisco González-Acuña, Wilbur Carrington Whitten, 1992 This

paper deals with the two broad questions of how 3 manifold groups imbed in one another and how such imbeddings relate to any corresponding lowercase Greek Π_1 injective maps In particular we are interested in 1 determining which 3 manifold groups are not cohopfian that is which 3 manifold groups imbed properly in themselves 2 determining the knot subgroups of a knot group and 3 determining when surgery on a knot K yields a lens or lens like space and the relationship of such a surgery to the knot subgroup structure of lowercase Greek Π_1 S^3 K Our work requires the formulation of a deformation theorem for lowercase Greek Π_1 injective maps between certain kinds of Haken manifolds and the development of some algebraic tools

Loop Groups, Discrete Versions of Some Classical Integrable Systems, and Rank 2 Extensions

Percy Deift, Luen-Chau Li, Carlos Tomei, 1992 The authors show how to interpret recent results of Moser and Veselov on discrete versions of a class of classical integrable systems in terms of a loop group framework In this framework the discrete systems appear as time one maps of integrable Hamiltonian flows Earlier results of Moser on isospectral deformations of rank 2 extensions of a fixed matrix can also be incorporated into their scheme

Degenerate Principal Series for Symplectic Groups Chris Jantzen, 1993 This paper is concerned with induced representations for p adic groups In particular Jantzen examines the question of reducibility in the case where the inducing subgroup is a maximal parabolic subgroup of $Sp_{2n} \mathbb{F}$ and the inducing representation is one dimensional Two different approaches to this problem are used The first based on the work of Casselman and of Gustafson reduces the problem to the corresponding question about an associated finite dimensional representation of a certain Hecke algebra The second approach is based on a technique of Tadić and involves an analysis of Jacquet modules This is used to obtain a more general result on induced representations which may be used to deal with the problem when the inducing representation satisfies a regularity condition The same basic argument is also applied in a case by case fashion to nonregular cases

Selberg Zeta Functions and Transfer Operators Markus Szymon

Fraczek, 2017-05-11 This book presents a method for evaluating Selberg zeta functions via transfer operators for the full modular group and its congruence subgroups with characters Studying zeros of Selberg zeta functions for character deformations allows us to access the discrete spectra and resonances of hyperbolic Laplacians under both singular and non singular perturbations Areas in which the theory has not yet been sufficiently developed such as the spectral theory of transfer operators or the singular perturbation theory of hyperbolic Laplacians will profit from the numerical experiments discussed in this book Detailed descriptions of numerical approaches to the spectra and eigenfunctions of transfer operators and to computations of Selberg zeta functions will be of value to researchers active in analysis while those researchers focusing more on numerical aspects will benefit from discussions of the analytic theory in particular those concerning the transfer operator method and the spectral theory of hyperbolic spaces

Unraveling the Integral Knot Concordance

Group Neal W. Stoltzfus, 1977 The group of concordance classes of high dimensional homotopy spheres knotted in codimension two in the standard sphere has an intricate algebraic structure which this paper unravels The first level of

invariants is given by the classical Alexander polynomial. By means of a transfer construction the integral Seifert matrices of knots whose Alexander polynomial is a power of a fixed irreducible polynomial are related to forms with the appropriate Hermitian symmetry on torsion free modules over an order in the algebraic number field determined by the Alexander polynomial. This group is then explicitly computed in terms of standard arithmetic invariants. In the symmetric case this computation shows there are no elements of order four with an irreducible Alexander polynomial. Furthermore the order is not necessarily Dedekind and non projective modules can occur. The second level of invariants is given by constructing an exact sequence relating the global concordance group to the individual pieces described above. The integral concordance group is then computed by a localization exact sequence relating it to the rational group computed by J. Levine and a group of torsion linking forms.

Handbook of Teichmüller Theory Athanase Papadopoulos, 2007. The subject of this handbook is Teichmüller theory in a wide sense namely the theory of geometric structures on surfaces and their moduli spaces. This includes the study of vector bundles on these moduli spaces, the study of mapping class groups, the relation with 3 manifolds, the relation with symmetric spaces and arithmetic groups, the representation theory of fundamental groups and applications to physics. Thus the handbook is a place where several fields of mathematics interact: Riemann surfaces, hyperbolic geometry, partial differential equations, several complex variables, algebraic geometry, algebraic topology, combinatorial topology, low dimensional topology, theoretical physics and others. This confluence of ideas toward a unique subject is a manifestation of the unity and harmony of mathematics. This volume contains surveys on the fundamental theory as well as surveys on applications to and relations with the fields mentioned above. It is written by leading experts in these fields. Some of the surveys contain classical material while others present the latest developments of the theory as well as open problems. This volume is divided into the following four sections: The metric and the analytic theory, The group theory, The algebraic topology of mapping class groups and moduli spaces, Teichmüller theory and mathematical physics. This handbook is addressed to graduate students and researchers in all the fields mentioned.

Projective Modules over Lie Algebras of Cartan Type Daniel Ken Nakano, 1992 This paper investigates the question of linkage and block theory for Lie algebras of Cartan type The second part of the paper deals mainly with block structure and projective modules of Lie algebras of types W and K

Abelian Coverings of the Complex Projective Plane Branched along Configurations of Real Lines Eriko Hironaka, 1993 This work studies abelian branched coverings of smooth complex projective surfaces from the topological viewpoint Geometric information about the coverings such as the first Betti numbers of a smooth model or intersections of embedded curves is related to topological and combinatorial information about the base space and branch locus Special attention is given to examples in which the base space is the complex projective plane and the branch locus is a configuration of lines

Mathematical Physics of Quantum Wires and Devices N.E. Hurt, 2013-03-14 This monograph on quantum wires and quantum devices is a companion volume to the author's Quantum Chaos and Mesoscopic Systems Kluwer Dordrecht 1997 The goal of this work is to present to the reader the mathematical physics which has arisen in the study of these systems The course which I have taken in this volume is to juxtapose the current work on the mathematical physics of quantum devices and the details behind the work so that the reader can gain an understanding of the physics and where possible the open problems which remain in the development of a complete mathematical description of the devices I have attempted to include sufficient background and references so that the reader can understand the limitations of the current methods and

have direction to the original material for the research on the physics of these devices As in the earlier volume the monograph is a panoramic survey of the mathematical physics of quantum wires and devices Detailed proofs are kept to a minimum with outlines of the principal steps and references to the primary sources as required The survey is very broad to give a general development to a variety of problems in quantum devices not a specialty volume Theory and Applications of Holomorphic Functions on Algebraic Varieties over Arbitrary Ground Fields Oscar Zariski, 1951
