Population, Panel on New Directions in Social Demography, Social Epidemiology, and the Sociology of Aging, 2013-12-26 The aging of the population of the United States is occurring at a time of major economic and social changes. These economic changes include consideration of increases in the age of eligibility for Social Security and Medicare and possible changes in benefit levels. Furthermore, changes in the social context in which older individuals and families function may well affect the nature of key social relationships and institutions that define the environment for older persons. Sociology offers a knowledge base, a number of useful analytic approaches and tools, and unique theoretical perspectives that can facilitate understanding of these demographic, economic, and social changes and, to the extent possible, their causes, consequences, and implications. *New Directions in the Sociology of Aging* evaluates the recent contributions of social demography, social epidemiology, and sociology to the study of aging and identifies promising new research directions in these subfields. Included in this study are nine papers prepared by experts in sociology, demography, social genomics, public health, and other fields that highlight the broad array of tools and perspectives that can provide the basis for further advancing the understanding of aging processes in ways that can inform policy. This report discusses the role of sociology in what is a wide-ranging and diverse field of study, a proposed three-dimensional conceptual model for studying social processes in aging over the life cycle, a review of existing databases, data needs and opportunities, primarily in the area of measurement of interhousehold and intergenerational transmission of resources, biomarkers, and biosocial interactions, and a summary of roadblocks and bridges to transdisciplinary research that will affect the future directions of the field of sociology of aging. Biology of Aging Roger B. McDonald, 2019-06-07 *Biology of Aging* Second Edition presents the biological principles that have led to a new understanding of the causes of aging and describes how these basic principles help one to understand the human experience of biological aging, longevity, and age-related disease. Intended for undergraduate biology students, it describes how the rate of biological aging is measured, explores the mechanisms underlying cellular aging, discusses the genetic pathways that affect longevity in various organisms, outlines the normal age-related changes and the functional decline that occurs in physiological systems over the lifespan, and considers the implications of modulating the rate of aging and longevity. The book also includes end-of-chapter discussion questions to help students assess their knowledge of the material. Roger McDonald received his Ph.D. from the University of Southern California and is Professor Emeritus in the Department of Nutrition at the University of California, Davis. Dr. McDonald's research focused on mechanisms of cellular aging and the interaction between nutrition and aging. His research addressed two key topics in the field: the relationship between dietary restriction and lifespan, and the effect of aging on circadian rhythms and hypothalamic regulation.
