An Introduction to Mass and Heat Transfer Stanley Middleman, 1997-10-30 This text is the outgrowth of Stanley Middleman's years of teaching and contains more than sufficient materials to support a one semester course in fluid dynamics His primary belief in the classroom and hence the material in this textbook is that the development of a mathematical analysis is central to the analysis and design of an engineering system or process His text is therefore oriented toward teaching students how to develop mathematical representations of physical phenomena Great effort has been put forth to provide many examples of experimental data against which the results of modeling exercises can be compared and to expose students to the wide range of technologies of interest to chemical environmental and bio engineering students Examples presented are motivated by real engineering applications and many of the problems are derived from the author's years of experience as a consultant to companies whose businesses cover a broad spectrum of engineering technologies

Convective Heat and Mass Transfer in Porous Media Sadik Kakaç, Birol Kilis, Frank A. Kulacki, Faruk Anıç, 2012-12-06 The rapid growth of literature on convective heat and mass transfer through porous media has brought both engineering and fundamental knowledge to a new state of completeness and depth Additionally several new questions of fundamental merit have arisen in several areas which bear direct relation to further advancement of basic knowledge and applications in this field For example the growth of fundamental heat transfer data and correlations for engineering use for saturated media has now reached the point where the relations for heat transfer coefficients and flow parameters are known well enough for design purposes Multiple flow field regimes in natural convection have been identified in several important enclosure geometries New questions have arisen on the nature of equations being used in theoretical studies i.e the Validity of Darcy assumption is being brought into question Wall effects in high and low velocity flow fields have been found to play a role in predicting

transport coefficients The formulation of transport problems in fractured media are being investigated as both an extension of those in a homogeneous medium and for application in engineering systems in geologic media and problems on saturated media are being addressed to determine their proper formulation and solution The long standing problem of how to adequately formulate and solve problems of multi phase heat and mass transfer in heterogeneous media is important in the technologies of chemical reactor engineering and enhanced oil recovery
