Heat Islands:

Heat Islands Lisa Gartland, 2012-05-16 Heat islands are urban and suburban areas that are significantly warmer than their surroundings. Traditional highly absorptive construction materials and a lack of effective landscaping are their main causes. Heat island problems in terms of increased energy consumption, reduced air quality, and effects on human health and mortality are becoming more pressing as cities continue to grow and sprawl. This comprehensive book brings together the latest information about heat islands and their mitigation. The book describes how heat islands are formed, what problems they cause, which technologies mitigate heat island effects, and what policies and actions can be taken to cool communities. Internationally renowned expert Lisa Gartland offers a comprehensive source of information for turning heat islands into cool communities. The author includes sections on cool roofing and cool paving, explains their benefits in detail, and provides practical guidelines for their selection and installation. The book also reviews how and why to incorporate trees and vegetation around buildings in parking lots and on green roofs.

Heat Islands Lisa Gartland, 2008 An excellent scientific book and a very useful source of knowledge. The author has succeeded in describing in a very comprehensive way all the recent scientific developments in this very important subject. The reader will be fully informed on the causes of heat islands, the scientific ways to document them, and also on all major mitigation techniques. This is a valuable reference not only for climatologists and climate experts but also for building engineers, architects, building physicists, researchers, and university students. Mat Santamouris, Associate Professor at the University of Athens, Greece.

Urban Climate Change and Heat Islands Riccardo Paolini, Mattheos Santamouris, 2022-11-14 *Urban Climate Change and Heat Islands: Characterization, Impacts, and Mitigation* serves as a go-to reference for a foundational understanding of urban climate drivers and impacts. Through the book's comprehensive chapters, the authors help readers identify problems associated with urban climate change along with potential solutions. Global case studies are included and presented in a way in which they become globally relevant to any urban or intra-urban environment. The authors call on their extensive experience to present and explore methodologies and approaches to quantifying urban heat mitigation measures in a clear manner, focusing on heat islands, urban overheating, and effects on air quality. Includes global case studies that demonstrate how to design and implement urban heat mitigation measures that are area-specific and effective under both current climate and future conditions. Provides an overview of urban parameterizations in models leading to an improved understating of intra-urban climate variability drivers. Assesses potential heat and air quality health impacts of excessive heat events and changes in local urban climates.

Adaptation Measures for Urban Heat Islands Hideki Takebayashi, Masakazu Moriyama, 2020-03-20 *Adaptation Measures for Urban Heat Islands* helps the reader understand the relative performance of these adaptation measures, methods, and analysis relating to their creation and maintenance, evaluation methods, and the role of policy and governance in implementing them. A suite of case studies is included on these urban or metropolitan areas that are significantly warmer.

than their surrounding rural areas due to human activities In recent years a suite of adaptation measures have been developed to mitigate the urban heat island phenomena Provides a range of concrete implementation methods Assesses relative performance of adaptation measures and countermeasure technologies Establishes methods for human thermal environmental interventions Reviews adaptation cities selected for excellent energy performance and thermal comfort indicators

Controlling Summer Heat Islands, 1989 **Tropical Urban Heat Islands** Nyuk Hien Wong, Yu Chen, 2008-08-29 This book explores the complex relationships between climate buildings and plants especially in urban heat islands to form a reference for researchers and professionals

Pavement Materials for Heat Island Mitigation Hui Li, 2015-08-19 About 90 percent of this excessive heat is due to buildings and pavements that absorb and store solar heat According to the Green Buildings Council The only reference that focuses specifically on pavements Pavement Materials for Heat Island Mitigation Design and Management Strategies explores different advanced paving materials their properties and their associated advantages and disadvantages Relevant properties of pavement materials e g albedo permeability thermal conductivity heat capacity and evaporation rate are measured in many cases using newly developed methods Includes experimental methods for testing different types of pavements materials Identifies different cool pavement strategies with their advantages and associated disadvantages Design and construct local microclimate models to evaluate and validate different cool pavement materials in different climate regions

URBAN HEAT ISLAND Ioana Herbel, 2020-09-15 The expansion without precedent of city boundaries determined the modification of the climatic conditions inside urban areas with a direct impact on the environment and the population Urban development implies fundamental changes in the natural setting generating significant differences between the urban environment and the nearby areas in terms of meteorological parameters air quality and energy balance Over the last decades cities worldwide have experienced accelerated development urbanization being one of the most important dimensions of global change In Eastern Europe another important matter is the forced industrialization from the communist era which lead to a complex process of urban change This change influenced the urban climate of post socialist cities In such cities the urban landscape was radically transformed with the emergence of over sized production units and dormitory neighborhoods meant to accommodate their personnel The replacement of natural surfaces with the built impervious ones with distinct caloric properties and lower cooling rates is known as one of the main factors that generate the urban heat island effect The topic of this book refers therefore to the urban heat island UHI as an example of climate change of anthropic origin and to its atmospheric biologic and economic impact Yow 2007 The UHI phenomenon implies a temperature difference between the densely built urban areas and the nearby rural ones

Urban Heat Island Modeling for Tropical Climates Ansar Khan, Soumendu Chatterjee, Yupeng Wang, 2020-11-17 Urban Heat Island Modeling for Tropical Climates takes into account the different urban physics in tropical environments presenting a way of UHI scaling for tropical cities Topics include measuring modeling and proper mitigation strategies which account for the

surface energy balance of tropics Tropical cities are more susceptible to the effects of projected global warming because of conditions in tropical climates and the rapid growth of so many cities in this zone The need for research on measuring modeling and mitigation of UHI effects in tropical cities is of growing importance This book walks through the basics of Urban Heat Islands including causes measurement and analysis then expands upon issues as well as the novel techniques that can be used to address issues specific to the region Reviews topics related to understanding the fundamentals of modeling and impacts of urban heat islands Covers many techniques from remote sensing to numerical modeling and then applying them to urban climate studies in general and in tropical cities Describes the scaling of urban heat islands based on long term seasonal thermal parameters as feature based classification systems using a probabilistic and fuzzy logic approach unlike local climate zones LCZs

Urban Heat Island (UHI) Mitigation Napoleon Enteria,Matteos Santamouris,Ursula Eicker,2020-12-14 This book discusses the concepts and technologies associated with the mitigation of urban heat islands UHIs that are applicable in hot and humid regions It presents several city case studies on how UHIs can be reduced in various areas to provide readers researchers and policymakers with insights into the concepts and technologies that should be considered when planning and constructing urban centres and buildings The rapid development of urban areas in hot and humid regions has led to an increase in urban temperatures a decrease in ventilation in buildings and a transformation of the once green outdoor environment into areas full of solar energy absorbing concrete and asphalt This situation has increased the discomfort of people living in these areas regardless of whether they occupy concrete structures This is because indoor and outdoor air quality have both suffered from urbanisation The development of urban areas has also increased energy consumption so that the occupants of buildings can enjoy indoor thermal comfort and air quality that they need via air conditioning systems This book offers solutions to the recent increase in the number of heat islands in hot and humid regions

Global Urban Heat Island Mitigation Ansar Khan,Hashem Akbari,Francesco Fiorito,Sk Mithun,Dev Niyogi,2022-06-15 Global Urban Heat Island Mitigation provides a comprehensive picture of global UHI micro thermal interaction in different built environments The book explains physical principles and how to moderate undesirable consequences of swift and haphazard urban development to create more sustainable and resilient cities Sections provide extensive discussion on numerous UHI mitigation technologies and their effectiveness in cities around the globe In addition the book proposes novel UHI mitigation technologies and strategies while also assessing the effectiveness and suitability of UHI mitigation interventions in various climates and urban forms Adopts a multidisciplinary approach bridging theoretical and applied urban climatology with urban heat mitigation Compiles disparate urban climate research concepts and technologies into a coherent framework Includes contributions from leaders in fields from around the globe

Remapping Urban Heat Island Atlases in Regenerative Cities Abusaada, Hisham,Elshater, Abeer,Khalifa, Marwa,2022-06-17 In the past decades protecting the urban environment in the face of environmentalism and environmental rights has become crucial to saving the planet from the

dangers of the rapid urban development of new cities and societies Air temperature is one of the factors influenced by climate change and contemporary city morphology that lacks compact city features Contemporary cities have taken on global paradigms adopting open fabric multiple and ultrahigh residential towers and superhuman scale spaces at the level of squares and public parks This type of planning results in a radical thermal transformation not only in the movement and transportation network but also in all public spaces and their external spaces It is essential to understand the dimensions and principles of urban planning and design in conjunction with the competence of environmental design to reduce the impact of the urban heat island UHI phenomenon Remapping Urban Heat Island Atlases in Regenerative Cities focuses on public health and wellbeing decent work and economic growth sustainable cities and societies and climate action It presents atlases of UHI based digital techniques and methods of modelling as well as the use of these atlases mapping and models in exploring the placemaking problems in the new cities Covering topics such as artificial intelligence pedestrian density mapping and urban heat island mitigation this premier reference source is a critical resource for architects city planners urban planners city officials government officials policymakers non profit organizations politicians engineers libraries students and educators of higher education researchers and academicians

Energy and Climate in the Urban Built Environment M. Santamouris, 2013-06-17 Both the number and percentage of people living in urban areas is growing rapidly Up to half of the world's population is expected to be living in a city by the end of the century and there are over 170 cities in the world with populations over a million Cities have a huge impact on the local climate and require vast quantities of energy to keep them functioning The urban environment in turn has a big impact on the performance and needs of buildings The size scale and mechanism of these interactions is poorly understood and strategies to mitigate them are rarely implemented This is the first comprehensive book to address these questions It arises out of a programme of work POLISTUDIES carried out for the Save programme of the European Commission Chapters describe not only the main problems encountered such as the heat island and canyon effects but also a range of design solutions that can be adopted both to improve the energy performance and indoor air quality of individual buildings and to look at aspects of urban design that can reduce these climatic effects The book concludes with some examples of innovative urban bioclimatic buildings The project was coordinated by Professor Mat Santamouris from the University of Athens who is also the editor of the book Other contributions are from the University of Thessaloniki Greece ENTPE Lyons France and the University of Stuttgart Germany

Designing High-Density Cities Edward Ng, 2010 Compact living is sustainable living High density cities can support closer amenities encourage reduced trip lengths and the use of public transport and therefore reduce transport energy costs and carbon emissions High density planning also helps to control the spread of urban suburbs into open lands improves efficiency in urban infrastructure and services and results in environmental improvements that support higher quality of life in cities Encouraging even requiring higher density urban development is a major policy and a central principle of growth management programmes used by planners around the world However such density creates design challenges and problems A collection of experts in each of the related architectural and planning areas examines these environmental and social issues and argues that high density cities are a sustainable solution It will be essential reading for anyone with an interest in sustainable urban development

Sustainable Resilient Built Environments Rama Devi Nandineni, Susan Ang, Norwina Binti Mohd Nawawi, 2024-07-05 The proceedings of Sustainable Resilient Built Environments are based on the SRBE 2022 conference held in December 2022 It focuses on the advances under the overarching theme of Sustainability The concept of Sustainability has been conventionally defined as meeting the needs of the present without compromising the ability of future generations to meet their own needs In scientific literature sustainable development has been analysed using different qualitative approaches such as economic social ecological cultural institutional ethical and political In this edited volume the concepts of both sustainability and resilience are considered to open up useful pathways towards achieving sustainable buildings and infrastructure Though the concepts of sustainability and resilience are considered to help improve the built environment the interrelations and interdependence between these two concepts are not clearly evident This has led to the questions such as Is the sustainable built environment always resilient Is the resilient built environment always sustainable What more is needed for sustainability In exploring these pertinent questions the proposed edited volume is expected to unveil and disseminate new insights on the themes related to sustainable and resilient built environment The themes of the proceedings lay a platform for researchers and professionals to integrate the aspects including smart innovation technologies green energy efficiency carbon reduction sustainability and resilience with regard to buildings and

other built infrastructure Specific objectives included as per the five themes are as follows Environment Design and Sustainability Sustainable Smart Buildings Community Resilience Social Sustainability Heritage and Sustainability Pandemic issues and sustainable development *The Urban Heat Island* Iain D. Stewart, Gerald Mills, 2021-05-25 The Urban Heat Island UHI is an area of growing interest for many people studying the urban environment and local global climate change The UHI has been scientifically studied for 200 years and although it is an apparently simple phenomenon there is considerable confusion around the different types of UHI and their assessment The Urban Heat Island A Guidebook provides simple instructions for measuring and analysing the phenomenon as well as greater context for defining the UHI and the impacts it can have Readers will be empowered to work within a set of guidelines that enable direct comparison of UHI effects across diverse settings while informing a wide range of climate mitigation and adaptation programs to modify human behaviour and the built form This opens the door to true global assessments of local climate change in cities Urban planning and design strategies can then be evaluated for their effectiveness at mitigating these changes Covers both on surface and near surface or canopy measurements and impacts of Urban Heat Islands UHI Provides a set of best practices and guidelines for UHI observation and analysis Includes both conceptual overviews and practical instructions for a wide range of uses
