Epilepsies Of Childhood:

Epilepsies of Childhood Niall V. Non-epileptic Childhood Paroxysmal Disorders Francis J. DiMario, 2009 This is a book written for those of us who evaluate the many quirks and behaviors encountered in the lives of developing children The number of important pathologic conditions that befall this age group is staggering However equally staggering is the number of episodic and often benign or developmentally programmed paroxysmal events encountered in this population The nature of these episodic events in many circumstances leads to their erroneous identification as epileptic in nature It is my hope that this book will serve as a compendium of those episodically manifest entities often uniquely observed in childhood The book is organized with some foundations in terminology and an in depth analysis of epidemiology of many of these disorders As best possible epidemiologic data are compiled with incidence and prevalence figures provided for comparisons Discussion on the deductive approach to their clinical assessment is provided along with emphasis on the diagnostic clues contained within the descriptive and observational information provided during clinical evaluation A categorization of the differential features and ages of presentation are provided as a means to help direct logical diagnostic considerations Subsequent chapters are organized by major topic i e Syncope Sleep Phenomena Somatization Factitious Illness Movement Disorders and Migraine Syndromes Each chapter provides discourse on the general principles of underlying pathophysiologic mechanisms and current knowledge about the chapter topic under discussion Specific clinical entities encompassed within the general topic are then discussed individually with particular attention to their clinical descriptions and presentations natural history particular pathophysiology genetics pertinent laboratory and treatments The text is amplified by pertinent tables highlighting diagnostic criteria where this applies and reference information where needed The text is generously referenced to encompass the most relevant information available

complex disorder demanding integrated medical educational and community services Its treatment encompasses acute and disability medicine The many types or syndromes of childhood epilepsy present both diagnostic and management challenges Although many children with epilepsy will be referred to specialist units the majority will initially present to paediatricians and paediatric neurologists This book provides a practical problem oriented manual to help clinicians with diagnosis evaluation and management This book addresses epilepsy as an evolving disorder from presentation through active disease and finally to either spontaneous remission or a chronic lifelong condition Structured on the child s age at presentation Childhood Epilepsy offers a practical overview for paediatricians paediatric neurologists and primary care practitioners who treat children with epilepsy in their daily practice

Benign Focal Epilepsies in Infancy, Childhood and Adolescence

N. Fejerman, Roberto Horacio Caraballo, 2007 It is well known that the incidence of epilepsies is higher in this age period than in any other time in the life span The frequent occurrence of seizures refractory to antiepileptic drug treatments is of great concern On the opposite side of the spectrum the group of benign epilepsy syndromes presented in this book is clearly more prevalent in childhood than the intractable epilepsies Neurologists and paediatricians should be familiar with these conditions because accurate diagnosis and its consequent good prognosis may save much suffering to the family Special emphasis however is given to the small proportion of children who in spite of presenting a usually benign disease show an atypical evolution which hampers their neuropsychological development It is fundamental to be aware of the possible ill effects of some antiepileptic drugs in these cases Finally advancements in the recognition of new and not so rare epileptic syndromes are presented All the subjects are supported by extensive experience of the authors based in large series of patients

Benign Localized and Generalized Epilepsies of Early Childhood R. Degen, Fritz E. Dreifuss, 1992 This volume is arranged so as to review the classification of the Epilepsies Epileptic Syndromes and Related Disorders International League Against Epilepsy and then the individual groups of benign epilepsies including benign childhood epilepsy with centrotemporal spike discharges benign epilepsy in childhood with occipital paroxysms and epilepsy in slow wave sleep Also included is a section followed by a discussion of the benign generalized epilepsies and the borderland between them and the more sinister conditions The definition of the syndrome has received further impetus by the discovery that some of the syndromes represented in the primary or idiopathic epilepsies have a distinct place in the human genome with a putative localization of juvenile myoclonic epilepsy on chromosome 6 and of benign familial neonatal convulsions on chromosome 20
