**Choice**, 1984      *Bulletin*, 1976      *The Science Teacher*, 1994      **Illinois Chemistry Teacher**, 1992      **Biology**, 1996      *Progress in Ecological Stoichiometry* Dedmer B. Van de Waal, James J. Elser, Adam C. Martiny, Robert W. Sterner, James B. Cotner, 2018 Ecological stoichiometry concerns the way that the elemental composition of organisms shapes their ecology It deals with the balance or imbalance of elemental ratios and how that affects organism growth nutrient cycling and the interactions with the biotic and abiotic worlds The elemental composition of organisms is a set of constraints through which all the Earth's biogeochemical cycles must pass All organisms consume nutrients and acquire compounds from the environment proportional to their needs Organismal elemental needs are determined in turn by the energy required to live and grow the physical and chemical constraints of their environment and their requirements for relatively large polymeric biomolecules such as RNA DNA lipids and proteins as well as for structural needs including stems bones shells etc These materials together constitute most of the biomass of living organisms Although there may be little variability in elemental ratios of many of these biomolecules changing the proportions of different biomolecules can have important effects on organismal elemental composition Consequently the variation in elemental composition both within and across organisms can be tremendous which has important implications for Earth's biogeochemical cycles It has been over a decade since the publication of Sterner and Elser's book *Ecological Stoichiometry* 2002 In the intervening years hundreds of papers on stoichiometric topics ranging from evolution and regulation of nutrient content in organisms to the role of stoichiometry in populations communities ecosystems and global biogeochemical dynamics have been published Here we present a collection

of contributions from the broad scientific community to highlight recent insights in the field of Ecological Stoichiometry

Development and Plasticity Contribute to Understanding Evolution of the Human Brain?** Roberto Lent, Fernanda  
Tovar-Moll, 2016-07-19 Humans usually attribute themselves the prerogative of being the pinnacle of evolution They have  
large brains with many billion neurons and glial cells trillions of synapses and besides all a plastic hardware that may change  
either subtly or strongly in response to the external environment and internal mental commands With this hypercomplex  
apparatus they are capable of very sophisticated inward computations and outward behaviors that include self recognition  
metacognition different forms of language expression and reception prediction of future events planning and performing long  
streams of motor acts subtle emotional feelings and many other surprising almost unbelievable properties The main  
challenge for research is how do we explain this gigantic achievement of evolution Is it a direct consequence of having  
acquired a brain larger than our primate ancestors with huge numbers of computational units Would it be determined by a  
particular way these units came to relate to each other building up logic circuits of powerful capacities What along  
development has made the difference for the construction of such a complex brain machine How much of this complexity is  
innate how much is sculpted by influence of the external world by social interaction with our human fellows and by the  
history of our own mental trajectory along life Many specific questions can be asked albeit not necessarily answered so far to  
this purpose 1 which genomic characteristics make us unique among primates 2 which of developmental events during and  
beyond embryogenesis define our brain prolonged neurogenesis permanent circuit re formation dynamic synaptogenesis  
regressive sculpting of the hardware all of them 3 is there anything special about plasticity of the human brain that allows us  
to build the exquisite individual variability characteristic of our brains Neuroscience is in need of a synthesis Perhaps  
associating concepts derived from developmental neurobiology with evolutionary morphology and physiology together with  
those that photograph the human brain in action under influence of the external world would turn on a light at the end of the  
tunnel and we would be able to understand what humans do have that is special if anything to explain our success in the
