The Planner's Guide to Natural Resource Conservation: Adrian X. Esparza,Guy McPherson,2009-06-12 Much of the country's recent population growth is situated in exurban areas By many accounts exurbanization has become the dominant pattern of land development in the country and there is no indication it will slow in the foreseeable future Theobald 2005

Brown et al 2005 Glennon and Kretser 2005 By definition exurban development takes place beyond the metropolitan fringe often in rural and remote areas The development of new exurban communities is a growing trend especially in the West In this case developers and homebuilders seek large tracts of land up to thousands of acres in rural areas typically within 50 miles of a large city where they plan entire communities consisting of commercial retail and residential land uses Recreational amenities such as golf courses and hiking biking trails are often included in these master planned developments Our philosophy is reflected in the book's two objectives First we seek to document the extent and impacts of exurban development across the country At issue is demonstrating why planners and the public at large should be concerned about exurbanization We will demonstrate that even though exurbanization favors amenity rich regions it affects all areas of the country through the loss of agricultural and grazing lands impacts to watersheds and land modification A summary of environmental impacts is presented including the loss of wildlands and agricultural productivity land modification soil erosion impacts to terrestrial hydrologic systems the loss of biodiversity nonnative and endangered species and other topics Our second aim is to provide readers from diverse nonscientific backgrounds with a working knowledge of how and why exurbanization impacts environmental systems This is accomplished by working closely to ensure contributors follow a specific outline for each chapter First contributors will spell out fundamental concepts principles and processes that apply to their area of expertise e g riparian areas Contributors will move beyond a cursory understanding of ecological processes without overwhelming readers with the dense material found typically in specialized texts For this reason visuals and other support materials will be integral to each chapter We have chosen contributors carefully based on their record as research scientists and acumen as educators Second once the mechanics have been laid out authors will explain how and why land development in nearby areas influences ecosystems Issues of interdependency modification and adaptation spatial scale and varying time horizons will be featured Third contributors will weigh in on the pros and cons of various land development schemes Fourth authors will share their thinking on the merits of conservation devices such as wildlife corridors open space requirements and watershed management districts Finally each chapter will conclude by identifying pitfalls to avoid and highlighting best practices that will mitigate environmental problems or avoid them altogether In sum after completing each chapter readers should have a firm grasp of relevant concepts and processes an understanding of current research and know how to apply science to land use decisions

Principles of Ecosystem Stewardship F Stuart Chapin III, Gary P.

Kofinas, Carl Folke, 2009-06-12 The world is undergoing unprecedented changes in many of the factors that determine its fundamental properties and their influence on society These changes include climate the chemical composition of the atmosphere the demands of a growing human population for food and fiber and the mobility of organisms and natural products cultural perspectives and information flows The magnitude and widespread nature of these changes pose serious challenges in managing the ecosystem services on which society depends Moreover many of these changes are strongly influenced by

human activities so future patterns of change will continue to be influenced by society's choices and governance. The purpose of this book is to provide a new framework for natural resource management: a framework based on stewardship of ecosystems for human well-being in a world dominated by uncertainty and change. The goal of ecosystem stewardship is to respond to and shape change in social ecological systems in order to sustain the supply and opportunities for use of ecosystem services by society. The book links recent advances in the theory of resilience, sustainability and vulnerability with practical issues of ecosystem management and governance. The book is aimed at advanced undergraduates and beginning graduate students of natural resource management as well as professional managers, community leaders and policy makers with backgrounds in a wide array of disciplines including ecology, policy studies, economics, sociology and anthropology. **Natural Resource**

Conservation Daniel D. Chiras, John P. Reganold, 2010. Intended for those interested in gaining a basic knowledge of natural resources and conservation. *Ecology, Law and Economics* Nicholas Mercuro, Franklin A. López, Kristian P. Preston, 1994.

This volume integrates the essentials of ecology with law and economics. The authors evaluate the conventional remedies of environmental economics in the light of integrated perspective and look to alternative remedies for environmental problems.

Natural Resources, Growth, and Development Clement A. Tisdell, 1990-09-18. This volume combines economics and ecology in a penetrating examination of the natural resources and environmental issues arising from economic growth, development and change. The author focuses particular attention on the environmental consequences of economic change and argues that the management and conservation of biological resources is a requirement for sustainable economic growth. By setting traditional economic issues within their wider environmental context and covering issues not ordinarily addressed by economists, Tisdell offers an important new perspective on the problem of resource scarcity. He examines the two conflicting viewpoints on the magnitude of the problem: those who argue that technological progress will make scarcity of natural resources less important and those who argue that economic growth can only be expected to intensify scarcity, suggesting a reasonable course of action that will allow acceptable levels of economic growth while protecting important natural resources. Tisdell's work will be useful both as a supplementary text for courses in development or environmental economics and as recommended reading in biology, environmental studies and ecology programs. Following an introduction which covers basic issues in resource scarcity along with growth and development, the author addresses the major economic, ethical and ecological issues involved in the conservation of biological resources. He goes on to examine concepts and changing views of sustainable economic growth, production and development. Subsequent chapters explore such topics as conservation in less developed countries and the economic pressures that hinder conservation efforts; differing views on depletable resources as limits to growth; rural-urban migration and its effects on labor allocation and foreign assistance to resource-poor developing countries. A case study of wildlife on New Zealand's Otago Peninsula is particularly useful in illustrating the economics of biological conservation. Throughout, Tisdell concentrates on providing a reasoned, balanced

assessment of the impact of economic growth and change on the natural environment that will be an important resource for proponents on both sides of the environment versus development debate Ecology and Natural Resource Management for Sustainable Development A.
