This historic book may have numerous typos and missing text. Purchasers can usually download a free scanned copy of the original book without typos from the publisher. Not indexed. Not illustrated. 1913 edition. Excerpt: CHAPTER XIII Scientific Methods In Part One of this book I tried to examine into the facts and methods which are commonly supposed to prove that there has been a succession of life on the globe. We found that this life succession theory has not a single fact to support it; that it is not the result of scientific research but wholly the product of an inventive imagination; that no one kind of fossil has ever been proved or can be proved to be intrinsically older than another or than Man himself; and hence that a complete reconstruction of geological theory is imperatively demanded by our modern knowledge. In short, that ancient world whose ruins we now have as fossils was a unit and simply an older state of our present world. All the important groups of living plants and animals have now been found as fossils, and their classification does not represent a time value in the one case any more than in the other. The geological

series of fossils represents merely taxonomic relationships just as would a similar arrangement of the living species nothing more In Part Two the following additional facts have been brought out 1 The abnormal character of much of the fossiliferous deposits 2 A radical and world wide change of climate 3 The marked degeneration in passing from the fossil world to the modern one 4 The fact that the human race to say nothing of a vast number of living species of plants and animals has participated in some of the greatest of the geological changes we really know not how to limit the number or character of these changes These additional facts still further emphasize the unity or solidarity of that ancient world They show how all its parts are indissolubly bound together in a common fate and how sharply

**Geodynamics of the Lithosphere** Kurt Stüwe, 2007-07-03 The large scale structure of the earth is caused by geodynamic processes which are explained using energetic kinematic and dynamic descriptions While geodynamic processes are understood to include a large variety of processes and the term is used quite loosely the methods of their description involve well defined fields Energetic descriptions are involved with distribution of energy in our planet typically expressed in terms of heat and temperature Kinematic descriptions describe movements using velocities strains and strain rates Dynamic descriptions indicate how stresses and forces behave In the field we document only the consequences of geological processes The underlying causes are much harder to constrain directly Nevertheless if we want to explain the tectonic evolution of our planet we need to interpret these causes or driving forces For this we need to find a dynamic description of geological processes that is consistent with our observations Our descriptions relate causes and consequences tectonic processes with field observations In many cases we will use equations as a concise form to describe processes and observations in nature As we will be dealing mostly with large scale tectonic questions the observations that we shall use are also on a large scale For example we shall use observations on the elevation Fig 1 1 and heat flow of mountain ranges the thickness of continents and the water depth of the oceans
