Physiological Ecology of North American Plant Communities Brain F. Chabot, 2012-12-06

Although as W. D. Billings notes in his chapter in this book the development of physiological ecology can be traced back to the very beginnings of the study of ecology it is clear that the modern development of this field in North America is due in the large part to the efforts of Billings alone. The foundation that Billings laid in the late 1950s came from his own studies on deserts and subsequently arctic and alpine plants and also from his enormous success in instilling enthusiasm for the field in the numerous students attracted to the plant ecology program at Duke University. Billings' own studies provided the model for subsequent work in this field. Physiological techniques normally confined to the laboratory were brought into the field to examine processes under natural environmental conditions. These field studies were accompanied by experiments under controlled conditions where the relative impact of various factors could be assessed and further where genetic as opposed to environmental influences could be separated. This blending of field and laboratory approaches promoted the design of experiments which were of direct relevance to understanding the distribution and abundance of plants in nature. Physiological mechanisms were studied and assessed in the context of the functioning of plants under natural conditions rather than as an end in itself. Recent Polar and Glaciological Literature, 1988 *Bryology for the Twenty-first Century* Jeffrey W. Bates, 2018-02-02

A compilation of state of the art papers on key topics in bryology from invited speakers at the Centenary Symposium University of Glasgow 57 August 1996. Managing a Sea Ing-Marie Gren, Kerry Turner, Fredrik Wulff, 2017-07-28

Marine resources and fish stocks are now high on the international and economic research agendas and the management of highly complex marine ecosystems is increasingly important. The task is complicated by the number of interlinked factors to be taken into account such as social impacts, drainage systems, marine currents and the ecosystems involved. This interdisciplinary volume presents a comprehensive blueprint for managing a sea. Focused on the Baltic Sea it employs a range of methods and techniques including nutrient budgets and simulation models. Geographical Information Systems, GIS, economic valuation and policy analysis to arrive at an assessment of causes and consequences of pollution in the sea and the management of its resources. From the analysis of data on land use, population costs of nutrient reductions and associated impacts it presents significant and highly practical empirical and policy results. It diagnoses the causes of marine degradation, identifies through the use of simulation models cost effective strategies for remediation and sets out the policies to be pursued collectively by the countries around the sea to restore and manage their common resource. This is an exemplary study in the application of ecological economics to complex natural resource systems. It will be of interest to students, researchers and professionals working on any aspect of marine ecosystem management.
