**Power Estimation and Optimization Methodologies for VLIW-based Embedded Systems** Vittorio Zaccaria,M.G. Sami,Donatella Sciuto,Cristina Silvano,2007-05-08 LOW power design is playing an important role in today ultra large scale integration ULSI design particularly as we continue to double the number of transistors on a die every two years and increase the frequency of operation at fairly the same rate Certainly an important aspect of low power faces with mobile communications and it has a huge impact on our lives as we are at the start line of the proliferation of mobile PDA s Personal Digital Assistants Wireless LAN and portable multi media computing All of these devices are shaping the way we will be interacting with our family peers and workplace thus requiring also a new and innovative low power design paradigm Furthermore low power design techniques are becoming paramount in high performance desktop base station and server applications such as high speed microprocessors where excess in power dissipation can lead to a number of cooling reliability and signal integrity concerns severely burdening the total industrialcost Hence low power design can be easily anticipated to further come into prominence as we move to next generation System on Chip and Network on Chip designs This book is entirely devoted to disseminate the results of a long term research program between Politecnico di Milano Italy and STMic electronics in the field of architectural exploration and optimization techniques to designing low power embedded systems *Embedded Systems Design with 8051 Microcontrollers* Zdravko Karakehayov,2018-10-08 A presentation of developments in microcontroller technology providing lucid instructions on its many and varied applications It focuses on the popular eight bit microcontroller the 8051 and the 83C552 The text outlines a systematic methodology for small scale control dominated embedded systems and is accompanied by a disk of all the example problems included in the book Architecture and Design of Distributed Embedded Systems Bernd Kleinjohann,2013-04-18 Due to the decreasing production costs of IT systems applications that had to be realised as expensive PCBs formerly can now be realised as a system on chip Furthermore low cost broadband communication media for wide area communication as well as for the realisation of local distributed systems are available Typically the market requires IT systems that realise a set of specific features for the end user in a given environment so called embedded systems Some examples for such embedded systems are control systems in cars airplanes houses or plants information and communication devices like digital TV mobile phones or autonomous systems like service or edutainment robots For the design of embedded systems the designer has to tackle three major aspects The application itself including the man machine interface The target architecture of the system including all functional and non functional constraints and the design methodology including modelling specification synthesis test and validation The last two points are a major focus of this book This book documents the high quality approaches and results that were presented at the International Workshop on Distributed and Parallel Embedded Systems DIPES 2000 which was sponsored by the International Federation for

Information Processing IFIP and organised by IFIP working groups WG10.3, WG10.4 and WG10.5. The workshop took place on October 18-19, 2000 in Schlo Eringerfeld near Paderborn, Germany. Architecture and Design of Distributed Embedded Systems is organised similar to the workshop. Chapters 1 and 4: Methodology I and II deal with different modelling and specification paradigms and the corresponding design methodologies. Generic system architectures for different classes of embedded systems are presented in Chapter 2. In Chapter 3, several design environments for the support of specific design methodologies are presented. Problems concerning test and validation are discussed in Chapter 5. The last two chapters include distribution and communication aspects (Chapter 6) and synthesis techniques for embedded systems (Chapter 7). This book is essential reading for computer science researchers and application developers.

**SPECC: Specification Language and Methodology** Daniel D. Gajski, Jianwen Zhu, Rainer Dömer, Andreas Gerstlauer, Shuqing Zhao, 2012-12-06. For the near future, the recent predictions and roadmaps of silicon semiconductor technology all agree that the number of transistors on a chip will keep growing exponentially according to Moore's Law, pushing technology towards the system on a chip (SOC) era. However, we are increasingly experiencing a productivity gap where the chip complexity that can be handled by current design teams falls short of the possibilities offered by technological advances. Together with growing time to market pressures, this drives the need for innovative measures to increase design productivity by orders of magnitude. It is commonly agreed that the solutions for achieving such a leap in design productivity lie in a shift of the focus of the design process to higher levels of abstraction on the one hand and in the massive reuse of pre-designed complex system components (intellectual property, IP) on the other hand. In order to be successful, both concepts eventually require the adoption of new languages and methodologies for system design, backed up by the availability of a corresponding set of system level design automation tools. This book presents the SpecC system level design language (SLDL) and the corresponding SpecC design methodology. The SpecC language is intended for specification and design of SOC or embedded systems including software and hardware, whether using fixed platforms, integrating systems from different IPs, or synthesizing the system blocks from programming or hardware description languages. SpecC: Specification Language and Methodology describes the SpecC methodology that leads designers from an executable specification to an RTL implementation through a well-defined sequence of steps. Each model is described and guidelines are given for generating these models from executable specifications. Finally, the SpecC methodology is demonstrated on an industrial size example. The design community is now entering the system level of abstraction era, and SpecC is the enabling element to achieve a paradigm shift in design culture needed for system product design and manufacturing. SpecC: Specification Language and Methodology will be of interest to researchers, designers, and managers dealing with system level design, design flows, and methodologies, as well as students learning system specification, modeling, and design.

Integrated System-Level Modeling of Network-on-Chip enabled Multi-Processor Platforms Tim Kogel, Rainer Leupers, Heinrich Meyr, 2006-08-25. We are presently observing a paradigm change in designing complex SoC as

it occurs roughly every twelve years due to the exponentially increasing number of transistors on a chip This design discontinuity as all previous ones is characterized by a move to a higher level of abstraction This is required to cope with the rapidly increasing design costs While the present paradigm change shares the move to a higher level of abstraction with all previous ones there exists also a key difference For the first time shrinking geometries do not lead to a corresponding increase of performance In a recent talk Lisa Su of IBM pointed out that in 65nm technology only about 25% of performance increase can be attributed to scaling geometries while the lion share is due to innovative processor architecture [1] We believe that this fact will revolutionize the entire semiconductor industry What is the reason for the end of the traditional view of Moore's law It is instructive to look at the major drivers of the semiconductor industry wireless communications and multimedia Both areas are characterized by a rapidly increasing demand of computational power in order to process the sophisticated algorithms necessary to optimally utilize the precious resource bandwidth The computational power cannot be provided by traditional processor architectures and shared bus type of interconnects The simple reason for this fact is energy efficiency there exist orders of magnitude between the energy efficiency of an algorithm implemented as a fixed functionality computational element and of a software implementation on a processor

**Networks on Chip** Axel Jantsch, Hannu Tenhunen, 2007-05-08 As the number of processor cores and IP blocks integrated on a single chip is steadily growing a systematic approach to design the communication infrastructure becomes necessary Different variants of packed switched on chip networks have been proposed by several groups during the past two years This book summarizes the state of the art of these efforts and discusses the major issues from the physical integration to architecture to operating systems and application interfaces It also provides a guideline and vision about the direction this field is moving to Moreover the book outlines the consequences of adopting design platforms based on packet switched network The consequences may in fact be far reaching because many of the topics of distributed systems distributed real time systems fault tolerant systems parallel computer architecture parallel programming as well as traditional system on chip issues will appear relevant but within the constraints of a single chip VLSI implementation
