High Performance Memory Systems Haldun Hadimioglu,David Kaeli,Jeffrey Kusk, Ashwini Nanda,Josep Torrellas,2011-06-27 The State of Memory Technology Over the past decade there has been rapid growth in the speed of microprocessors CPU speeds are approximately doubling every eighteen months while main memory speed doubles about every ten years The International Technology Roadmap for Semiconductors ITRS study suggests that memory will remain on its current growth path The ITRS short and long term targets indicate continued scaling improvements at about the current rate by 2016 This translates to bit densities increasing at two times every two years until the introduction of 8 gigabit dynamic random access memory DRAM chips after which densities will increase four times every five years A similar growth pattern is forecast for other high density chip areas and high performance logic e g microprocessors and application specific integrated circuits ASICs In the future molecular devices 64 gigabit DRAMs and 28 GHz clock signals are targeted Although densities continue to grow we still do not see significant advances that will improve memory speed These trends have created a problem that has been labeled the Memory Wall or Memory Gap
