10 years Coho salmon have been shown to be sensitive to habitat alterations and we use coho salmon parr as the primary indicator in the protocol A priori criteria for type I and type II error rates effect size and sample sizes for the protocol were derived with estimates of variance computed from the 3 year pilot study The protocol is designed to detect trends in abundance of coho salmon parr as well as coho salmon fry and Dolly Varden *Salvelinus malma* in small streams managed according to TLMP standards and guidelines and to compare these to trends in unmanaged old growth watersheds Trends are adjusted to account for statistically significant habitat covariates This information provides an important element in monitoring land management practices in the Tongass National Forest The methods we describe may have application to monitoring protocols elsewhere for fish populations and land management practices *Gallatin National Forest (N.F.), Noxious and Invasive Weed Treatment Project* ,2005 **Hiawatha National Forest (N.F.), Niagara** ,2009
