
Advances in Neonatal Neurology

REBECCA N. ICHORD, MD

Since the advent of neonatal intensive care, improvements in survival among critically ill newborns have outpaced our ability to prevent their neurologic complications. This article reviews hemorrhagic and hypoxic-ischemic neurologic complications in newborn infants. Progress has been made in defining the pathogenesis of cerebral injury stemming from disturbed cerebral circulation and energy metabolism, but its management remains controversial. Cranial ultrasound and brain magnetic resonance imaging (MRI) have defined a broader spectrum of cerebral lesions in greater anatomic detail than was previously appreciated. Progress in treatment will depend in part on developing better techniques to monitor the effect of drugs and physiologic interventions on cerebral physiology and function.

NEUROLOGIC COMPLICATIONS OF PREMATURE: PERIVENTRICULAR HEMORRHAGE AND LEUKOMALACIA

roanatomic and metabolic vulnerabilities to adverse events. Hypoxia and ischemia and their systemic complications are the leading causes of brain injury associated with premature birth. As prenatal brain disorders such as malformations and infections contribute to a minority of the neurologic problems in premature infants, they will not be discussed further here.

Premature infants experience a high incidence of hemorrhage in response to hypoxia and ischemia when compared to full-term infants. The distribution and severity of injury is largely related to the unique vulnerability of periventricular white matter and germinal matrix in the 26-to-32-week premature infant. The vulnerability of the premature brain to hypoxic-ischemic events is determined by the state of brain development at that time. Neural tube forma-
