

The Research Situation in West Germany

Forschung in der Bundesrepublik Deutschland. Beispiele, Kritik, Vorschläge. CHRISTOPH SCHNEIDER, Ed. Verlag Chemie, Deerfield Beach, Fla., 1983. xvi, 976 pp. \$41.

The title and format of this lengthy but surprisingly readable compilation suggest a routine, discipline-by-discipline review of the status of West German science. In fact, this book is much more important and revealing. The leaders of the Deutsche Forschungsgemeinschaft (DFG, German Research Association) have produced a volume laced with penetrating insight into the difficulties faced by current German researchers; it will be both praised and condemned within the ongoing controversy over the disenchanting quality of West German science.

In the immediate aftermath of the Third Reich, the Germans faced the combined impact of the forced emigration of thousands of talented researchers in the 1930's, the wartime devastation of personnel and facilities, and the intellectual isolation that persisted into the postwar period. As the postwar economy strengthened and West Germany regained a measure of its place in international affairs, research conditions began to improve. Efforts to construct a coherent science policy, however, were confounded by federal claims to manage the economic implications of science and state claims to administer its educational and cultural elements. Eventually, in the 1950's, a division of labor emerged whereby the states supported institutions whose functions included teaching (notably the universities and institutes of technology) and the state and federal governments jointly funded research organizations and institutions of supranational significance (among them the network of Max Planck Society institutes, the DFG, and the Grossforschungseinrichtungen—Big Science establishments—such as the space program, the nuclear research center at Karlsruhe, or the electron-synchrotron facilities at Hamburg). Coordination and long-range planning were entrusted to a Science Council of notables representing all interested parties. This was an extremely complex process, since numerous coor-

minating bodies were erected to aid communication and generate consensus, and there were also scores of lesser laboratories and organizations (not to mention industrial facilities) to be fitted somehow into the scheme. Although organizational structures have flourished, substantive achievements and international competitiveness have not seemed to return to pre-Nazi heights.

One of the reasons is that the once-vaunted universities have become the Achilles heel of the German research enterprise. Reforms initiated in the 1960's were designed to grant broader access to higher education and break down the often overweening authority of the full professors. Developments included both rapid expansion of the university system and entry of the federal government (from 1969 on) into planning and funding procedures. The result for science has been at best problematic—the universities are overcrowded, bureaucratically stifled, underfunded, and simply not as attractive to the best young researchers as the laboratories of the more politically insulated Max Planck Society institutes. The fear is that the universities—the training ground for the coming generation—will deteriorate, while other institutions fare rather well.

The generic difficulties of maintaining an effective scientific research base in a time of economic downturn have made the German situation of interest abroad, especially in Britain, as a recent succession of major articles in *Interdisciplinary Science Reviews*, *Nature*, and *The New Scientist* attests. Creating positions for the young and embarking on university-industry-government ventures in high technology are two solutions currently being pursued in the Federal Republic. Yet the overall impression of the German research enterprise is one of tentativeness and a lack of ability to move the unwieldy system toward improvement.

Immobility does not stem from a lack of ideas. A plethora of theoretical and programmatic works has combined with frequent structural reorganization—the Federal Ministry of Research and Technology has had six different names and redefinitions since 1955—to produce a morass of competing conceptions and

proposals for change. There are so many ideas that there are few clear lines of debate, although a general division exists on whether to spread research funds around widely or to support best science (*Spitzenforschung*) disproportionately.

The present volume documents the DFG's position on behalf of best science. Ever since it was founded as an emergency association in the aftermath of World War I, the primary purpose of the DFG has been independent and impartial dispensation of government grants to individuals and research teams. Its interests encompass basic and technical research in the physical, biological, and social sciences plus the humanities (rather like a combined National Science Foundation, National Institutes of Health, and National Endowment for the Humanities). The DFG is thus directly concerned not only with discussing the state of German science but with doing something about it.

Publication of this book as a reflection of the DFG's concern indicates the impasse that has been reached. Rather than take an overtly political stand or add yet another programmatic treatise to the list, the notion here is to present an argument for what constitutes good research by an empirical method: nearly a hundred scholars, scientists, and engineers were asked to reflect on their own fields and careers and then suggest improvements. Their memoranda—a more apt designation for the contributions than "articles"—are thus largely autobiographical, often quite personal. (The sequence of represented disciplines—from Roman archeology through history, literature, the social sciences, biological and medical disciplines, chemistry, and physics eventually to machine tools and transportation technologies—may appear confusing but roughly follows the organization of grant proposal offices in the DFG.) The result is at times trivial, but more often refreshing, sobering, and thought-provoking. It is an effort not to map the research forefront or to poll the representatives of best science but to provide a sense of the wellspring of German creativity and quality in science.

Many themes that emerge in this book are predictable. A number of authors stress the role of accident in good research, and several others emphasize that too much planning and inflexible paperwork accounting are antagonistic to the freewheeling imagination essential to discovery. Some note an unwillingness to take risks and follow bold new thought rather than safe, incremental advancement.
