Alpine Plant Life Christian Körner,2013-06-29 Generations of plant scientists have been fascinated by alpine plant life with the exposure of organisms to dramatic climatic gradients over a very short distance This comprehensive text treats a wide range of topics alpine climate and soils plant distribution and the treeline phenomenon physiological ecology of water nutritional and carbon relations of alpine plants plant stress and plant development biomass production aspects of reproductive biology and human impacts on alpine vegetation Geographically the book covers all parts of the world including the tropics

Serpentine Geocology of Western North America Earl B. Alexander,2007-03-22 This book is about geology soils and plant communities in serpentine landscapes of western North America Aspects of the interaction of geology and soils reveal a fascinating symbiosis relating the structure composition and distribution of plant communities The plants that survive are a unique group There are some entire genera or even families of plants that are common throughout California that are poorly represented on serpentine while other genera are more diverse on serpentine than on other soils Serpentine rocks have dramatic effects on the vegetation that grows on them Many common plants cannot grow on serpentine soils leaving distinctive suites of plants to occupy serpentine habitats The floristic diversity associated with serpentine soils formed above ultramafic rocks is surprising considering that these soils are toxic to many plants Serpentine barrens of California often look like moonscapes but here we find numerous species of plants of low biomass that produce a richness of species rarely found in the world

Terrestrial Vegetation of California, 3rd Edition Michael Barbour, Todd Keeler-Wolf, Allan A. Schoenherr, 2007-07-17 This completely new edition of *Terrestrial Vegetation of California* clearly documents the extraordinary complexity and richness of the plant communities and of the state and the forces that shape them. This volume is a storehouse of information of value to anyone concerned with meeting the challenge of understanding, managing or conserving these unique plant communities under the growing threats of climate change, biological invasions and development. Harold Mooney, Professor of Environmental Biology, Stanford University. The plants of California are under threat like never before. Traditional pressures of development and invasive species have been joined by a newly recognized threat: human caused climate change. It is essential that we thoroughly understand current plant community dynamics in order to have a hope of conserving them. This book represents an important, well-timed advance in knowledge of the vegetation of this diverse state and is an essential resource for professionals, students and the general public alike. Spehn, 2024-11-01 This book is the result of the first global conference on mountain biodiversity and is a contribution to the International Year of Mountains 2002. The Global Mountain Biodiversity Assessment program is a Special Target Area Region project of DIVERSITAS UNESCO and UNEP. Biological diversity is essential for the integrity of mountain ecosystems and this dependency is likely to increase as environmental climate and social conditions change. Steep terrain and climate and severe land use pressure cause mountain ecosystems to rank among the world's most endangered landscapes. The 28 chapters in this book represent research on the biological riches in all major mountain ranges of the world and synthesize existing knowledge on mountain biodiversity from diversity of bacteria, plants and animals to human diversity. The book is divided into five sections: an introduction providing an overview of the issues; plant and animal diversity; climate change and mountain biodiversity; land use and conservation; and a synthesis. Biodiversity and Ecosystem Function Ernst-Detlef Schulze, 1994-07-26 With the accelerating loss of biodiversity there is increasing concern about how this loss may be affecting ecosystem processes or services that are of benefit to human well-being. The limited studies that address the principal question directly: species numbers versus system function are evaluated. Moreover, the degree of redundancy within systems, the ubiquity of keystone species, the tightness of species interactions from mutualisms to food webs, the resilience of systems to perturbation, the interactions of landscape units are explored, as is also how policy decisions are driven in this research area.
