Interacting Electrons in Reduced Dimensions Dionys Baeriswyl, David K. Campbell, 2012-12-06 As its name

suggests the 1988 workshop on Interacting Electrons in Reduced Dimensions the wide variety of physical effects that are associated with possibly systems focused on strongly correlated electrons interacting in quasi one and quasi two dimensional materials Among the phenomena discussed were superconductivity magnetic ordering the metal insulator transition localization the fractional Quantum Hall effect QHE Peierls and spin Peierls transitions conductance fluctuations and sliding charge density CDW and spin density SDW waves That these effects appear most pronounced in systems of reduced dimensionality was amply demonstrated at the meeting Indeed when concrete illustrations were presented they typically involved chain like materials such as conjugated polymers inorganic CDW systems and organic conductors or layered materials such as high temperature copper oxide superconductors certain of the organic superconductors and the QHE samples or devices where the electrons are confined to a restricted region of sample e.g the depletion layer of a MOSFET To enable this broad subject to be covered in thirty five lectures and about half as many posters the workshop was deliberately focused on theoretical models for these phenomena and on methods for describing as faithfully as possible the true behavior of these models This latter emphasis was especially important since the inherently many body nature of problems involving interacting electrons renders conventional effective single particle mean field methods e.g Hartree Fock or the local density approximation in density functional theory highly suspect Again this is particularly true in reduced dimensions where strong quantum fluctuations can invalidate mean field results

Theoretical Aspects of Band Structures and Electronic Properties of Pseudo-One-Dimensional Solids Hitomi Kimura, 1985-10-31 This volume presents a sequence of articles which describe the theoretical treatments of investigating the fundamental features in the electronic structures and properties of typical quasi one dimensional solids: organic conductor TTF TCNQ, polyacetylene, metallic and superconducting polymer SN_n and linear chain chalcogenides and halides of transition elements including NbSe₃. The aim of this volume is not to present an exhaustive review but rather to touch on a selective class of problems which appear to be fundamental for typical quasi one dimensional solids. Thus the topics in this volume are rather confined to the key basic properties of quasi one dimensional systems. The quasi one dimensional solids are one of the most extensively investigated subjects in current physics, chemistry and materials science. These materials are unique in attracting a broad range of scientists: chemists, experimental and theoretical physicists, materials scientists and engineers. In 1954 Frohlich constructed a theory of superconductivity based on a one dimensional model of moving charge density waves. In 1955 Peierls predicted that a one dimensional metal is unstable against the distortion of a periodic lattice so that a metal-nonmetal transition occurs at a certain temperature for a one dimensional metal. According to these theories a gap is opened at the Fermi surfaces of one dimensional conductors at low temperatures and the charge density wave is created in connection with the occurrence of the gap. *Solitons And Polarons In Conducting Polymers* Lu Yu, 1988-08-01 Polyacetylene CH_x is the simplest conjugated polymer. Pristine polyacetylene is a good insulator whereas its highly doped version exhibits metal like electrical conductivity. This book gives a detailed introduction to this rapidly developing field, is given along with a collection of original papers. The main purpose is to help chemists and physicists grasp the main ideas and most important facts; an expert may also find it useful as a reference volume.
