Performance Based Building Design 2 Hugo S. L. Hens, 2012-10-11 Just like building physics performance based building design was hardly an issue before the energy crises of the 1970ies With the need to upgrade energy efficiency the interest in overall building performance grew The term performance encompasses all building related physical properties and qualities that are predictable during the design stage and controllable during and after construction The term predictable demands calculation tools and physical models that allow evaluating a design whereas controllable presumes the existence of measuring methods available on site The basis for a system of performance arrays are the functional demands the needs for accessibility safety well being durability energy efficiency and sustainability and the requirements imposed by the usage of a building In continuation of Vol 1 this second volume discusses light weight construction with wooden and metal elements roofing systems facades and ends with finishes and the overall risk analysis Most chapters build on a same scheme overview overall performance evaluation design and construction The work is absolutely recommended to undergraduates and graduates in architectural and building engineering though also building engineers who want to refresh their knowledge may benefit The level of discussion assumes the reader has a sound knowledge of building physics along with a background in structural engineering building materials and building construction Where and when needed input and literature from over the world was used reason why each chapter ends listing references and literature
