How can economics contribute to environmental and social sustainability? The significance of systems theory and the embedded economy

Keith R. Skene*

Biosphere Research Institute, Letham, United Kingdom

Concerns relating to resource extraction, manufacturing, waste in our supply chains, along with increasing consumption and with their consequences for the planet, have, to a greater or lesser extent, begun to impact the ideological approach and the decision-making of governments, business and consumers alike on the material world we continue to create. Parallel concerns circle around social and environmental resilience, recovery and sustainability. This paper seeks to explore what a sustainable economy should look like in order to contribute to a resilient, diverse and thriving planet, while furthering resilient, diverse and thriving communities. It is argued that at the center of any sustainability theory, whether economic, environmental or social, lies the Earth system. The Earth system represents much more than the organisms sharing this planet with ourselves. Rather, it involves the fluxes of radiation, food energy, water, nutrients and heat. More essentially, it determines our niche space [the multidimensional space where tolerances and requirements interact to determine the habitable space within which an organism can practice its way of life]. Given that humans are some of the most vulnerable organisms on the planet in terms of the narrow range of conditions within which they can survive, the dynamic nature of the planet that determines this range of conditions must surely form the prime focus of our attentions. The Earth System, like all complex, far-from-equilibrium systems, is self-organizing, self-assembling, emergent, non-linear and governed by real-time feedback and sub-optimality at each level of its organization. The consequences of these properties for our economic activities and, indeed, for our own species, are discussed. It is further argued that we need an embedded economy. Fundamental to this exploration are the concept of *zusammenhang* (literally, hanging together), as developed by Humboldt, and the concept of the Earth as a super-organism, as developed by Hutton. Natural economics within the Earth system is explored and key properties of this economy are highlighted. The embedded economy functions in a way that facilitates natural and social recovery, resilience and functionality, while in resonance with the key characteristics of the Earth system. Artificial intelligence, utilizing ecological intelligence rather than human intelligence, and the internet of things, are identified as potentially significant tools in the establishment of an embedded economy.

Preferences in Negotiations Henner Gimpel,2007-06-13 Negotiations are ubiquitous in business politics and private life In many cases their outcome is of great importance Yet negotiators frequently act irrationally and fail to reach mutually beneficial agreements Cognitive biases like overconfidence egocentrism and the mythical fixed pie illusion oftentimes foreclose profitable results A further cognitive bias is the attachment effect Parties are influenced by their subjective expectations formed on account of the exchange of offers they form reference points and loss aversion potentially leads to a change of preferences when expectations change This book presents a motivation formalization and substantiation of the

attachment effect Thereby preferences and behavior are approached from a microeconomic and a psychological perspective Two experiments show clear evidence for a systematic bias The results can be used for prescriptive advice to negotiators either for debiasing or to systematically affect the counterpart **Urban Water Planning** Herbert Alfred Swenson,1972
