## Effective Polynomial Computation:

**Effective Polynomial Computation** Richard Zippel, 2012-12-06 Effective Polynomial Computation is an introduction to the algorithms of computer algebra. It discusses the basic algorithms for manipulating polynomials including factoring polynomials. These algorithms are discussed from both a theoretical and practical perspective. Those cases where theoretically optimal algorithms are inappropriate are discussed and the practical alternatives are explained. Effective Polynomial Computation provides much of the mathematical motivation of the algorithms discussed to help the reader appreciate the mathematical mechanisms underlying the algorithms and so that the algorithms will not appear to be constructed out of whole cloth. Preparatory to the discussion of algorithms for polynomials, the first third of this book discusses related issues in elementary number theory. These results are either used in later algorithms, e.g., the discussion of lattices and Diophantine approximation, or analogs of the number theoretic algorithms are used for polynomial problems, e.g., Euclidean algorithm and  $p$ -adic numbers. Among the unique features of Effective Polynomial Computation is the detailed material on greatest common divisor and factoring algorithms for sparse multivariate polynomials. In addition, both deterministic and probabilistic algorithms for irreducibility testing of polynomials are discussed. *Polynomial and Matrix Computations* Dario Bini, Victor Y. Pan, 2012-12-06 Our Subjects and Objectives This book is about algebraic and symbolic computation and numerical computing with matrices and polynomials. It greatly extends the study of these topics presented in the celebrated books of the seventies, AHU and BM; these topics have been underrepresented in CLR, which is a highly successful extension and updating of AHU. Otherwise, compared to AHU and BM, our volume adds extensive material on parallel computations with general matrices and polynomials, on the bit complexity of arithmetic computations including some recent techniques of data compression, and the study of numerical approximation properties of polynomial and matrix algorithms, and on computations with Toeplitz matrices and other dense structured matrices. The latter subject should attract people working in numerous areas of application, in particular coding, signal processing, control, algebraic computing, and partial differential equations. The authors' teaching experience at the Graduate Center of the City University of New York and at the University of Pisa suggests that the book may serve as a text for advanced graduate students in mathematics and computer science who have some knowledge of algorithm design and wish to enter the exciting area of algebraic and numerical computing. The potential readership may also include algorithm and software designers and researchers specializing in the design and analysis of algorithms, computational complexity, algebraic and symbolic computing, and numerical computation. Polynomial Algorithms in Computer Algebra Franz Winkler, 2012-12-06 For several years now I have been teaching courses in computer algebra at the Universität Linz, the University of Delaware, and the Universidad de Alcalá de Henares. In the summers of 1990 and 1992 I have organized and taught summer schools in computer algebra at the Universität Linz. Gradually, a set of course notes has emerged from these activities. People have asked me for copies of the

course notes and different versions of them have been circulating for a few years Finally I decided that I should really take the time to write the material up in a coherent way and make a book out of it Here now is the result of this work Over the years many students have been helpful in improving the quality of the notes and also several colleagues at Linz and elsewhere have contributed to it I want to thank them all for their effort in particular I want to thank B Buchberger who taught me the theory of Gröbner bases nearly two decades ago B F Caviness and B D Saunders who first stimulated my interest in various problems in computer algebra G E Collins who showed me how to compute in algebraic domains and J R Sendra with whom I started to apply computer algebra methods to problems in algebraic geometry Several colleagues have suggested improvements in earlier versions of this book However I want to make it clear that I am responsible for all remaining mistakes
