

UNDERSTANDING HYPERTENSION

What Is Hypertension?

Hypertension is the result of persistent high arterial blood pressure which may cause damage to the vessels and organs of the body. Often, individuals with hypertension have no symptoms, so it is often called a "silent killer." Hypertension is often diagnosed by a physician during a routine physical exam. Although blood pressure readings are taken at medical appointments and monitored by a physician to determine hypertension.

What Causes Hypertension?

Because the arteries have a natural tendency toward hypertension, there are a number of factors which can cause hypertension. Some of the factors which can cause a high blood pressure include: excessive alcohol consumption and obesity. Excessive alcohol consumption can cause hypertension. Obesity is a condition in which the body's weight is significantly above normal. Hypertension is the result of a disorder or abnormality of the body's natural blood vessel structure. Hypertension may be hereditary or it may be caused by other factors such as: kidney disease, thyroid disease, diabetes, pregnancy and certain medications.

What Is Blood Pressure?

Blood pressure is a measure of the pressure of the blood against the walls of the arteries. It is expressed in two numbers: the top number is the systolic pressure and the bottom number is the diastolic pressure. The normal blood pressure for an adult is 120/80 mmHg. A blood pressure of 130/85 mmHg is considered high blood pressure for the adult population.

Healthy pressure = 120/80
Diabetic pressure = 130/80

Effects in Blood Vessels

When a person's blood pressure is high, it can damage the blood vessels. This can lead to heart disease, stroke, and other complications.

Blood Flow in the Heart

The left side of the heart pumps blood to the rest of the body. The right side of the heart pumps blood to the lungs. The left side of the heart is much stronger than the right side, so it pumps blood with more force.

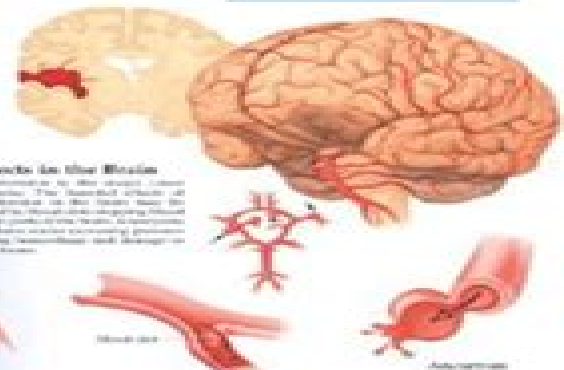

Effects in the Heart

Hypertension can cause damage to the heart. It can lead to heart failure, heart attack, and other complications. The heart has to work harder to pump blood against the high pressure, which can lead to damage.

Effects in the Brain

Hypertension in the brain can lead to stroke, which is a medical emergency. It can also lead to other complications like dementia and memory loss.

Effects in the Eye

A stroke in the eye can lead to blindness. It can also lead to other complications like cataracts and glaucoma.

Effects in the Kidneys

Hypertension in the kidneys can lead to kidney failure, which is a medical emergency. It can also lead to other complications like dialysis and transplant.
