**Urban Wildlife Habitats** Lowell W. Adams,1994 Urban Wildlife Habitats was first published in 1994 Minnesota Archive Editions uses digital technology to make long unavailable books once again accessible and are published unaltered from the original University of Minnesota Press editions In cities towns and villages between buildings and parking lots streets and sidewalks and polluted streams and rivers there is ever less space for the natural the plants and animals that once were at home across North America In this first book length study of the subject Lowell W Adams reviews the impact of urban and suburban growth on natural plant and animal communities and reveals how with appropriate landscape planning and urban development cities and towns can be made more accommodating for a wide diversity of species including our own Soils and ground surface air water and noise pollution space and demographics are among the urban characteristics Adams considers in relation to wildlife He describes changes in the composition and structure of vegetation as native species are replaced by exotic ones and shows how with spreading urbanization of natural habitats the diversity of species of plants and animals

almost always declines although the density of a few species increases Adams contends however that it is possible for a wide variety of species to coexist in the metropolitan environment and he cites a growing interest in the practice of natural landscaping which emphasizes the use of native species and considers the structure pattern and species composition of vegetation as it relates to wildlife needs Urban habitats vary from small city parks in densely built downtowns to suburbs with large yards and considerable open space Adams discusses the opportunities these areas along with school yards hospital grounds cemeteries individual residences and vacant lots provide for judicious wildlife management and for the salutary interaction of people with nature Lowell W Adams is vice president of the National Institute for Urban Wildlife in Columbia Maryland

Ambast, 2012-12-06 Organisms and environment have evolved through modifying each other over millions of years Humans appeared very late in this evolutionary time scale With their superior brain attributes humans emerged as the most dominating influence on the earth Over the millennia from simple hunter food gatherers humans developed the art of

agriculture domestication of animals identification of medicinal plants devising hunting and fishing techniques house building and making clothes All these have been for better adjustment growth and survival in otherwise harsh and hostile surroundings and climate cycles of winter and summer and dry and wet seasons So humankind started experimenting and acting on ecological lines much before the art of reading writing or arithmetic had developed Application of ecological knowledge led to development of agriculture animal husbandry medicines fisheries and so on Modern ecology is a relatively young science and unfortunately there are so few books on applied ecology The purpose of ecology is to discover the principles that govern relationships among plants animals microbes and their total living and nonliving environmental components Ecology however had remained mainly rooted in botany and zoology It did not permeate hard sciences engineering or industrial technologies leading to widespread environmental degradation pollution and frequent episodes leading to mass deaths and diseases
