Science Evaluation and Its Management Václav Pačes, Ladislav Pivec, Albert H. Teich, 1999 Evaluation of scientific research particularly of research which is supported by government funds is a matter of growing concern in virtually every nation It is no longer adequate to expect that the value of investments in research will be judged in long term historical perspective Resources are scarce and policy makers are looking for ways to assure that these resources are used in the most effective way From the life or death evaluations of academic research institutes in the post communist countries to the Government Performance and Results Act GPRA in the United States research evaluation has become a topic of utmost importance in science policy Evaluation often has substantial consequences for researchers and research institutions including restructuring shifting of priorities budget reductions or even closures Therefore it is essential that evaluation is done systematically and objectively with methodologies that can be understood and trusted by those concerned This book is based on a NATO Advanced Research Workshop co organized by the Academy of Sciences of the Czech Republic and the American Association for the Advancement of Science It describes a range of the most up to date methods of science evaluation and the experience with their implementation in many countries This book can be of interest to researchers policy makers practitioners of science evaluation and many others interested in science policy

Kahan, Dietram A. Scheufele, 2017-05-17 The proposal to vaccinate adolescent girls against the human papilloma virus ignited political controversy as did the advent of fracking and a host of other emerging technologies These disputes attest to the persistent gap between expert and public perceptions Complicating the communication of sound science and the debates that surround the societal applications of that science is a changing media environment in which misinformation can elicit belief without corrective context and likeminded individuals are prone to seek ideologically comforting information within their own self constructed media enclaves Drawing on the expertise of leading science communication scholars from six countries The Oxford Handbook of the Science of Science Communication not only charts the media landscape from news and entertainment to blogs and films but also examines the powers and perils of human biases from the disposition to seek confirming evidence to the inclination to overweight endpoints in a trend line In the process it draws together the best available social science on ways to communicate science while also minimizing the pernicious effects of human bias The

Handbook adds case studies exploring instances in which communication undercut or facilitated the access to scientific evidence The range of topics addressed is wide from genetically engineered organisms and nanotechnology to vaccination controversies and climate change Also unique to this book is a focus on the complexities of involving the public in decision making about the uses of science the regulations that should govern its application and the ethical boundaries within which science should operate The Handbook is an invaluable resource for researchers in the communication fields particularly in science and health communication as well as to scholars involved in research on scientific topics susceptible to distortion in partisan debate

Making Science Stephen Cole,1992 The sociology of science is dominated today by relativists who boldly argue that the content of science is not influenced by evidence from the empirical world but is instead socially constructed in the laboratory Making Science is the first serious critique by a sociologist of the social constructivist position Stephen Cole begins by making a distinction between two kinds of knowledge the core which consists of those contributions that have passed the test of evaluation and are universally accepted as true and important and the research frontier which is composed of all work in progress that is still under evaluation Of the thousands of scientific contributions made each year only a handful end up in the core What distinguishes those that are successful Agreeing with the constructivists Cole argues that there exists no set of rules that enables scientists to certify the validity of frontier knowledge This knowledge is underdetermined by the evidence and therefore social factors such as professional characteristics and intellectual authority can and do play a crucial role in its evaluation But Cole parts company with the constructivists when he asserts that it is impossible to understand which frontier knowledge wins a place in the core without first considering the cognitive characteristics of the contributions He concludes that although the focus of scientific research the rate of advance and indeed the everyday making of science are influenced by social variables and processes the content of the core of science is constrained by nature In Making Science Cole shows how social variables and cognitive variables interact in the evaluation of frontier knowledge
