Event Based Science Series Survive:

Introducing Survival and Event History Analysis Melinda Mills, 2011-01-19 This book is an accessible practical and comprehensive guide for researchers from multiple disciplines including biomedical epidemiology engineering and the social sciences Written for accessibility this book will appeal to students and researchers who want to understand the basics of survival and event history analysis and apply these methods without getting entangled in mathematical and theoretical technicalities Inside readers are offered a blueprint for their entire research project from data preparation to model selection and diagnostics Engaging easy to read functional and packed with enlightening examples hands on exercises conversations with key scholars and resources for both students and instructors this text allows researchers to quickly master advanced statistical techniques It is written from the perspective of the user making it suitable as both a self learning tool and graduate level textbook Also included are up to date innovations in the field including advancements in the assessment of model fit unobserved heterogeneity recurrent events and multilevel event history models Practical instructions are also included for using the statistical programs of R STATA and SPSS enabling readers to replicate the examples described in the text

Survival and Event History Analysis Odd Aalen, Ornulf Borgan, Hakon Gjessing, 2008-09-16 The aim of this book is to bridge the gap between standard textbook models and a range of models where the dynamic structure of the data manifests itself fully The common denominator of such models is stochastic processes The authors show how counting processes martingales and stochastic integrals fit very nicely with censored data Beginning with standard analyses such as Kaplan Meier plots and Cox regression the presentation progresses to the additive hazard model and recurrent event data Stochastic processes are also used as natural models for individual frailty they allow sensible interpretations of a number of surprising artifacts seen in population data The stochastic process framework is naturally connected to causality The authors show how dynamic path analyses can incorporate many modern causality ideas in a framework that takes the time aspect seriously To make the material accessible to the reader a large number of practical examples mainly from medicine are developed in detail Stochastic processes are introduced in an intuitive and non technical manner The book is aimed at investigators who use event history methods and want a better understanding of the statistical concepts It is suitable as a textbook for graduate courses in statistics and biostatistics

Models for Multi-State Survival Data Per Kragh Andersen, Henrik Ravn, 2023-10-11 Multi state models provide a statistical framework for studying longitudinal data on subjects when focus is on the occurrence of events that the subjects may experience over time They find application particularly in biostatistics medicine and public health The book includes mathematical detail which can be skipped by readers more interested in the practical examples It is aimed at biostatisticians and at readers with an interest in the topic having a more applied background such as epidemiology This book builds on several courses the authors have taught on the subject Key Features Intensity based and marginal models Survival data competing risks illness death models recurrent events Includes a full

chapter on pseudo values Intuitive introductions and mathematical details Practical examples of event history data Exercises Software code in R and SAS and the data used in the book as well as solutions to the exercises can be found on the book's webpage <https://multi-state-book.github.io/companion>

is the interdisciplinary study of power and the intersection of personality society and politics The field also examines how the political process is affected by major social trends as well as exploring how social policies are altered by various social forces Political sociologists increasingly use a wide variety of relatively new quantitative and qualitative methodologies and incorporate theories and research from other social science cognate disciplines The contributors focus on the current controversies and disagreements surrounding the use of different methodologies for the study of politics and society and discussions of specific applications found in the widely scattered literature where substantive research in the field is published This approach will solidly place the handbook in a market niche that is not occupied by the current volumes while also covering many of the same theoretical and historical developments that the other volumes cover The purpose of this handbook is to summarize state of the art theory research and methods used in the study of politics and society This area of research encompasses a wide variety of perspectives and methods that span social science disciplines The handbook is designed to reflect that diversity in content method and focus In addition it will cover developments in the developed and underdeveloped worlds

Targets of Terror Laura N. Bell, 2021-06-29 Targets of Terror addresses the repercussions of assassination as a tactic of terrorism and delineates post assassination political outcomes across target types Assassination of heads of state such as John F Kennedy and Yitzhak Rabin are rare events but the political murders of police personnel local government officials politicians and journalists occur frequently These softer targets are often pursued during broader campaigns of terrorist violence and the Global Terrorism Database GTD records a significant number of these assassination events 16 246 to be exact between 1977 and 2017 Utilizing survival analysis and the Polity IV Index to examine the span of time from a terrorist assassination to potential shifts in state political institutions Laura N Bell compares changes in authoritarian mixed and tumultuous regimes with democratic governments She argues that these cases illuminate the extent to which the type of assassination target may or may not be linked to significant institutional change By establishing differences in post assassination political outcomes across regimes and targets Bell provides a baseline study upon which to build future examinations of the types and severity of risks to governmental institutions during terror campaigns

Studying Tree Responses to Extreme Events Achim Bräuning,Andreas Bolte,Cristina Nabais,Sergio Rossi,Ute Sass-Klaassen,2017-06-05 Trees are among the longest living organisms They are sensitive to extreme climatic events and document the effects of environmental changes in form of structural modifications of their tissues These modifications represent an integrated signal of complex biological responses enforced by the environment For example temporal change in stem increment integrates multiple information of tree performance and wood anatomical traits may be altered by climatic extremes or environmental stress Recent developments in preparative tools and computational image analysis enable to quantify changes in wood anatomical features like vessel density or vessel size Thus impacts on their functioning can be related to climatic forcing factors Similarly new developments in monitoring cambial phenology and mechanistic modelling are enlightening the interrelationships between environmental factors wood formation and tree performance and mortality Quantitative wood anatomy is a reliable indicator of drought occurrence during the growing season and therefore has been studied intensively in recent years The variability in wood anatomy not only alters the biological and hydraulic functioning of a tree but may also influence the technological properties of wood with substantial impacts in forestry On a larger scale alterations of sapwood and phloem area and their ratios to other functional traits provide measures to detect changes in a tree s life functions and increasing risk of drought induced mortality with possible impacts on hydrological processes and species composition of plant communities Genetic variability within and across populations is assumed to be crucial for species survival in an unpredictable future world The magnitude of genetic variation and heritability of adaptive traits might define the ability to adapt to climate change Is there a relation between genetic variability and resilience to climate change Is it possible to link genetic expression and climate change to obtain deeper knowledge of functional genetics To derive precise estimates of genetic determinism it is important to define adaptive traits in wood properties and on a whole tree scale Understanding the mechanisms ruling these processes is fundamental to assess the impact of extreme climate events on forest ecosystems and to provide realistic scenarios of tree responses to changing climates Wood is also a major carbon sink with a long term residence impacting the global carbon

cycle How well do we understand the link between wood growth dynamics wood carbon allocation and the global carbon cycle Papers contribution to this Research Topic will cover a wide range of ecosystems However special relevance will be given to Mediterranean type areas These involve coastal regions of four continents making Mediterranean type ecosystems extremely interesting for investigating the potential impacts of global change on growth and for studying responses of woody plants under extreme environmental conditions For example the ongoing trend towards warmer temperatures and reduced precipitation can increase the susceptibility to fire and pests The EU funded COST Action STREeSS Studying Tree Responses to extreme Events a SynthesiS addresses such crucial tree biological and forest ecological issues by providing a collection of important methodological and scientific insights about the current state of knowledge and by opinions for future research needs
