Florissant Butterflies A Guide To The Fossil :

Florissant Butterflies Thomas C. Emmel, Marc C. Minno, Boyce A. Drummond, 1992 This is an illustrated treatment of and guide to all the fossil and present day species of butterflies in one of the richest areas in North America for butterfly diversity and study For much of the year the meadows forests and grassy slopes of the Florissant region of central Colorado are alive with butterflies nearly 100 species of these fascinating and beautiful creatures Many of them have unusual life histories the larvae caterpillars of one species take two years to mature others develop close associations with ants and the adults of some species live only a few days whereas others survive for months in winter hibernation Central Colorado is also the site of the Florissant Fossil Beds National Monument which has yielded 12 of the 44 known species of butterfly fossils in the world To find fossils of these delicate winged creatures in such a perfect state of preservation is one of the major wonders of nature since the fossils have endured 35 million years of geologic activity erosion and climate change remarkably most of the fossil species are closely related to various present day species [Checklist of North American Butterflies](#)

Poinar, 1992 Amber is a semi precious gem that is formed over eons by

natural forces out of the resin of trees Human fascination with amber dates back to prehistoric times when it was probably considered to have magical powers and was used for adornment and trade Amber amulets and beads dating from 35 000 to 1 800 B C have been found and where they have been found for example in graves hundreds of miles from their chemically determined origins has often helped to establish ancient trade routes The preservative qualities of plant resins were well known by the ancients The Egyptians used resins to embalm their dead and the Greeks used them to preserve their wine Amber often preserved fossils frequently in a pristine state of all kinds of animal and plant organisms that made contact with the sticky substance and became trapped in it These fossils include such fragile organisms as nematodes and mushrooms that ordinarily are not preserved under normal processes of fossilization as well as larger organisms like scorpions and lizards and the fossils are preserved in their full three dimensional form complete with minute details of scales mouth parts antennae and hairs It has even been suggested that viable DNA may persist in some amber trapped organisms This book is a compendium of all that we know about life found in amber It surveys all life forms from microbes to vertebrates and plants that have been reported from amber deposits throughout the world beginning with the earliest pieces dating from some 300 million years ago It also describes the formation of amber and the location geological history and early exploration of the major world amber deposits including those still being worked today The book also provides practical information on how to determine fake amber containing present day forms of life It can serve as a beginning for tracing the geological history of a particular group of animals or plants or even reconstructing ancient paleoenvironments and because amber fossils are preserved so completely in a transparent medium they can be intimately compared with related living species Finally the book discusses what amber fossils can tell us about evolution and speciation cellular preservation and paleosymbiosis The book is illustrated with 37 color photographs 154 black and white photographs and drawings and 8 maps

Fossil Insects David Penney, James E Jepson, 2014-07-31 Palaeoentomology represents the interface between two huge scientific disciplines palaeontology the study of fossils and entomology the study of insects However fossils rarely feature extensively in books on insects and likewise insects rarely feature in books about fossils Similarly college or university palaeontology courses rarely have an entomological component and entomology courses do not usually consider the fossil record of insects in any detail This is not due to a lack of insect fossils The fossil record of insects is incredibly diverse in terms of taxonomic scope age range Devonian to Recent mode of preservation amber and rock and geographical distribution fossil insects have been recorded from all continents including Antarctica In this book the authors aim to help bridge the palaeontology entomology gap by providing a broadly accessible introduction to some of the best preserved fossil insects from a wide range of deposits from around the globe many of which are beautifully illustrated by colour photographs Also covered are insect behaviour and ecology in the fossil record sub fossil insects trace fossils and insect species longevity Just as insects are useful as ecological

indicators today the same can be expected to be true of the past Such applications of the insect fossil record are briefly discussed It is hoped that this book will encourage a few future researchers to enter the fascinating realm of palaeoentomology and to this end there is a section on how to become a palaeoentomologist However it is aimed at a much broader audience those with an interest in fossils and or insects in general who will no doubt marvel at the diversity and excellent preservation of the fossils illustrated
