Future Atmospheric Carbon Dioxide Scenarios and Limitation Strategies Jae Edmonds, 1986 **Energy Abstracts for Policy Analysis**, 1986 *Stochastic and Statistical Methods in Hydrology and Environmental Engineering* Keith W. Hipel, 2012-12-06

Objectives The current global environmental crisis has reinforced the need for developing flexible mathematical models to obtain a better understanding of environmental problems so that effective remedial action can be taken Because natural phenomena occurring in hydrology and environmental engineering usually behave in random and probabilistic fashions stochastic and statistical models have major roles to play in the protection and restoration of our natural environment Consequently the main objective of this edited volume is to present some of the most up to date and promising approaches to stochastic and statistical modelling especially with respect to groundwater and surface water applications Contents As shown in the Table of Contents the book is subdivided into the following main parts GENERAL ISSUES PART I PART II GROUNDWATER PART III SURFACE WATER PART IV STOCHASTIC OPTIMIZATION PART V MOMENT ANALYSIS PART VI OTHER TOPICS Part I raises some thought provoking issues about probabilistic modelling of hydro logical and environmental systems The first two papers in Part I are in fact keynote papers delivered at an international environmetrics conference held at the University of Waterloo in June 1993 in honour of Professor T E Unny In his keynote pa per Dr S J Burges of the University of Washington places into perspective the historical and future roles of stochastic modelling in hydrology and environmental engineering Additionally Dr Burges stresses the need for developing a sound scien tific basis for the field of hydrology Professor P E **Global Warming and the Greenhouse Effect, January 1979 - May 1989** Jayne T. Duraiappah, 2012-12-06 The computer revolution both in the hardware as well as in software has made it possible for economists to analyze complex issues which could not be solved in the past by analytical methods A large library of numerical techniques are now available to economists for solving models ranging from a simple system of linear simultaneous equations to large non linear dynamic optimization models We attempt to take advantage of these advancements in computational economics to address the issue of global warming and economic development The use of computer simulation models has enhanced the understanding of some of the underlying issues in the global warming literature which would have been impossible without these models However to date the global warming issue has been addressed in a partial equilibrium framework In other words the climate scientists tend to specify economic variables as exogenous variables in their global warming models while the economists do the same by specifying the climate variables as exogenous variables in their global warming models Both approaches ignore important feedback relationships which will be triggered when either economic or climate variables are perturbed The ideal model structure would be one in which both systems are incorporated within one framework with emphasis on the long run effects of greenhouse gas curbing policies and the corresponding effect on the economic growth potential of the economies **Global Climate Change Pathfinder** Chestalene Pintozzi, Douglas E. Jones, 1992 **Crop Protection Strategies: Under Climate Change Scenarios** P.
