A comprehensive introduction to tropical ecology This full color illustrated textbook offers the first comprehensive introduction to all major aspects of tropical ecology It explains why the world s tropical rain forests are so universally rich in species what factors may contribute to high species richness how nutrient cycles affect rain forest ecology and how ecologists investigate the complex interrelationships among flora and fauna It covers tropical montane ecology riverine ecosystems savanna dry forest and more Tropical Ecology begins with a historical overview followed by a sweeping discussion of biogeography and evolution and then introduces students to the unique and complex structure of tropical rain forests Other topics include the processes that influence everything from species richness to rates of photosynthesis how global climate change may affect rain forest characteristics and function how fragmentation of ecosystems affects species richness and ecological processes human ecology in the tropics biodiversity and conservation of tropical ecosystems and species Drawing on real world examples taken from actual research Tropical Ecology is the best textbook on the subject for advanced undergraduates and graduate students Offers the first comprehensive introduction to tropical ecology Describes all the major kinds of tropical terrestrial ecosystems Explains species diversity evolutionary processes and coevolutionary interactions Features numerous color illustrations and examples from actual research Covers global warming deforestation reforestation fragmentation and conservation The essential textbook for advanced undergraduates and graduate students Suitable for courses with a field component Leading universities that have adopted this book include Biola University Bucknell University California State University Fullerton Colorado State University Fort Collins Francis Marion University Michigan State University Middlebury College Northern Kentucky University Ohio Wesleyan University St Mary s College of Maryland Syracuse University Tulane University University of California Santa Cruz University of Central Florida University of Cincinnati University of Florida University of Missouri University of New Mexico University of North Carolina at Chapel Hill University of the West Indies

Trophic Cascades John Terborgh, James A Estes, 2013-06-25 Trophic cascades the top down regulation of ecosystems by predators are an essential aspect of ecosystem function and well being Trophic cascades are often drastically disrupted by human

interventions for example when wolves and cougars are removed allowing deer and beaver to become destructive yet have only recently begun to be considered in the development of conservation and management strategies

Trophic Cascades is the first comprehensive presentation of the science on this subject It brings together some of the world's leading scientists and researchers to explain the importance of large animals in regulating ecosystems and to relate that scientific knowledge to practical conservation Chapters examine trophic cascades across the world's major biomes including intertidal habitats coastal oceans lakes nearshore ecosystems open oceans tropical forests boreal and temperate ecosystems low arctic scrubland savannas and islands Additional chapters consider aboveground belowground linkages predation and ecosystem processes consumer control by megafauna and fire and alternative states in ecosystems An introductory chapter offers a concise overview of trophic cascades while concluding chapters consider theoretical perspectives and comparative issues **Trophic Cascades** provides a scientific basis and justification for the idea that large predators and top down forcing must be considered in conservation strategies alongside factors such as habitat preservation and invasive species It is a groundbreaking work for scientists and managers involved with biodiversity conservation and protection

Primary Productivity of the Biosphere H. Lieth, R.H. Whittaker, 2012-12-06 The period since World War II and especially the last decade influenced by the International Biological Program has seen enormous growth in research on the function of ecosystems The same period has seen an exponential rise in environmental problems including the capacity of the Earth to support man's population The concern extends to man's effects on the biosphere the film of living organisms on the Earth's surface that supports man The common theme of ecologic research and environmental concerns is primary production the binding of sunlight energy into organic matter by plants that supports all life Many results from the IBP remain to be synthesized but enough data are available from that program and other research to develop a convincing summary of the primary production of the biosphere the purpose of this book The book had its origin in the parallel interests of the two editors and Gene E Likens which led them to prepare a symposium on the topic at the Second Biological Congress of the American Institute of Biological Sciences in Miami Florida October 24 1971 Revisions of the papers presented at that symposium appear as Chapters 2 8 9 10 and 15 in this book We have added other chapters that complement this core these include discussion and evaluation of methods for measuring productivity and regional production current findings on tropical productivity and models of primary productivity
