A Boole Anthology James Gasser, 2013-11-11 Modern mathematical logic would not exist without the analytical tools first developed by George Boole in *The Mathematical Analysis of Logic* and *The Laws of Thought* The influence of the Boolean school on the development of logic always recognised but long underestimated has recently become a major research topic This collection is the first anthology of works on Boole It contains two works published in 1865 the year of Boole's death but never reprinted as well as several classic studies of recent decades and ten original contributions appearing here for the first time From the programme of the English Algebraic School to Boole's use of operator methods from the problem of interpretability to that of psychologism a full range of issues is covered The Boole Anthology is indispensable to Boole studies and will remain so for years to come

Mathematics in Berlin Heinrich Begehr, Helmut Koch, Jürg Kramer, Norbert Schappacher, Ernst-Jochen Thiele, 2012-12-06 This little book is conceived as a service to mathematicians attending the 1998 International Congress of Mathematicians in Berlin It presents a comprehensive condensed overview of mathematical activity in Berlin from Leibniz almost to the present day without however including biographies of living mathematicians Since many towering figures in mathematical history worked in Berlin most of the chapters of this book are concise biographies These are held together by a few survey articles presenting the overall development of entire periods of scientific life at Berlin Overlaps between various chapters and differences in

style between the chapters were inevitable but sometimes this provided opportunities to show different aspects of a single historical event for instance the Kronecker Weierstrass controversy The book aims at readability rather than scholarly completeness There are no footnotes only references to the individual bibliographies of each chapter Still we do hope that the texts brought together here and written by the various authors for this volume constitute a solid introduction to the history of Berlin mathematics

The Moon that Wasn't Helge Kragh, 2008-11-06 The planet Venus is the closest neighbour to the Earth and in several respects similar to our globe It revolves around the Sun at an average distance of 0.72 astronomical units in an elliptical orbit of eccentricity 0.007 The corresponding 3 numbers for the Earth are 1 and 0.017 The mean density of Venus is 5.2 g cm³ that of the Earth 5.5 g cm³ Venus acceleration of gravity at its equator is 8.922 m s⁻² compared with 9.8 m s⁻² at the Earth The escape velocity is 10.4 km s⁻¹ while the corresponding figure of the Earth is 11.2 km s⁻¹ Although the mass of Venus is

somewhat smaller than that of the Earth the ratio is $M_M / M_E = 0.815$ the diameters of the two planets are almost the same In other words Venus is indeed a sister planet of the Earth In earlier times when almost nothing was known about the physical conditions of Venus the similarity appeared even stronger than today Not only was Venus period of rotation thought to be close to that of the Earth it was also possible and indeed common to imagine intelligent life on Venus
