*Inorganic Chemistry* Egon Wiberg, Nils Wiberg, 2001 **The Physics of Diamond** Società italiana di fisica, 1997 Diamond is an extreme material among possible atomic aggregations in nature and as such has many extreme properties This unique position makes it a fascinating subject both for science and for applications This has been particularly true in recent years since the surprising discovery at Union Carbide 1953 of the possibility of chemical vapour deposition of diamond films at low pressures where diamond is metastable with respect to graphite This discovery cleared the way to the

development of economical deposition techniques that have been obtaining progressively better quality diamond both pure and doped in a controlled way and for a variety of applications. The remarkable properties and applications range from mechanical the extreme hardness tensile and compressive strength wear performance to thermal the highest conductivity optical wide range of transparency chemical inertness to most chemicals biological biocompatibility and electronic high electronic carrier mobility large band gap and dielectric breakdown strength negative electron affinity with the simultaneous presence of so many extraordinary qualities often resulting in added value for a given application. We are presently at a turning point in the development of diamond physics and applications. While some achievements can be considered well established on the other hand new opportunities and challenges are facing the scientific community particularly with regard to novel exciting deposition processes and techniques or new properties and applications in electronics. This Enrico Fermi Course on The Physics of Diamond is particularly focused on the new developments and prospects which may well constitute a reference point for a new generation of scientists at what may possibly be the beginning of a new age in diamond. The course attracted several of the most distinguished experts in the field as lecturers and an audience of almost as distinguished students and observers from 19 countries. Participation and discussions were lively to the very last day ranging from traditional diamond physics to new diamond physics and from well known applications to the new exciting opportunities. The material in this volume is organized in the following way: the first part 13 lectures is essentially devoted to growth and structure; the second part to properties and applications with a closing lecture exploring new exotic diamonds in the distant future. The earlier lectures extensively cover the many processes of plasma chemical vapour deposition including advanced contributions in theoretical modelling of these processes. Novel deposition mechanisms are considered: low temperature CVD and laser activated processes including the so called QQC experiments. This first part closes with a discussion of amorphous phases. In the second part particular emphasis is placed on electronic properties and applications. This includes an extensive discussion of doping and in addition the promising perspectives of diamond as an electron emitter. Its newly discovered remarkable electron affinity properties lead to a new dimension in research and development of great strategical importance for an increasing role of diamond in electronics.

**Chemical Oceanography and the Marine Carbon Cycle** Steven Emerson, John Hedges, 2008-04-24

The principles of chemical oceanography provide insight into the processes regulating the marine carbon cycle. The text offers a background in chemical oceanography and a description of how chemical elements in seawater and ocean sediments are used as tracers of physical biological chemical and geological processes in the ocean. The first seven chapters present basic topics of thermodynamics isotope systematics and carbonate chemistry and explain the influence of life on ocean chemistry and how it has evolved in the recent glacial interglacial past. This is followed by topics essential to understanding the carbon cycle including organic geochemistry air sea gas exchange diffusion and reaction kinetics the marine and atmosphere carbon cycle and diagenesis in marine sediments.
