

Effective Ingredients in Psychotherapy: Prediction of Outcome From Process Variables

Beverly Gomes-Schwartz
McLean Hospital

This study was designed to examine the impact of (a) exploration of the psychodynamic roots of patients' conflicts, (b) warmth and friendliness of the therapist-offered relationship, and (c) positiveness of patients' attitudes toward working in therapy on the outcome of brief therapy with 35 college males exhibiting symptoms of depression, anxiety, and social introversion. Analyses of process ratings for audiotaped segments from four sessions throughout the course of therapy revealed that the activities of therapists of differing theoretical orientations and of professional versus untrained, "inherently helpful" therapists could be distinguished. Although patients' attitudes toward the therapist and patient involvement in the therapy process did not differ as a function of the type of therapist, the process dimension that most consistently predicted therapy outcome was patient involvement. Exploratory processes and therapist-offered relationship had a lesser influence on outcome.

Questions about how psychotherapy works—what qualities in the patient, the therapist, and the process of their interaction contribute to the amelioration of the patient's psychic distress—have generated considerable debate among proponents of varying systems of psychotherapy. Some of the issues that have prompted the widest discussion include (a) the relative importance of the patient-therapist relationship, as opposed to specialized techniques of intervention, and (b) the relevance of patients' attitudes toward the therapist and the therapy process.

Relationship Versus Technique

Rogers (1957) asserted that the consistent communication of genuine warmth and empathic understanding by the therapist is sufficient to produce constructive personality change. As long as the therapist is able to offer the patient a warm human relationship, even the most recalcitrant psychotic patients can eventually be reached (Rogers, Gendlin, Kiesler, & Truax, 1967).

In contrast, psychodynamic therapists have emphasized the importance of exploratory techniques—clarification, interpretation, confrontation—for producing the cognitive and emotional insight considered instrumental for change (Bibring, 1954; Glover, 1955; Langs, 1973). Even though a number of analytically oriented therapists have noted the significance of the patient-therapist relationship or therapeutic alliance (Greenson, 1967; Zetzel, 1956), there are fundamental differences between most dynamic therapists and the Rogerians. The analytic therapist is cautioned to maintain the role of an expert healer rather than try to be a friendly or equal partner in an interpersonal relationship. Although the trust and rapport engendered by a good therapeutic relationship may be necessary to facilitate

The field of counseling and psychotherapy has for years presented the puzzling spectacle of unabating enthusiasm for forms of treatment whose effectiveness cannot be objectively demonstrated. With few exceptions statistical studies have consistently failed to show that any form of psychotherapy is followed by significantly more improvement than would be caused by the mere passage of an equivalent period of time. Despite this practitioners of various psychotherapeutic schools have remained firmly convinced that their methods are effective. Many recipients of these forms of treatment also believe that they are being helped. The series of investigations reported in this impressive book resolve this paradoxical state of affairs. The investigators have overcome two major obstacles to progress in the past: lack of agreement on measures of improvement and difficulty of measuring active ingredients of the psychotherapy relationship. The inability of therapists of different theoretical persuasions to agree on criteria of improvement has made comparison of the results of different forms of treatment nearly impossible. The authors have solved this intractable problem by using a wide range of improvement measures and showing that regardless of measures used in different studies a significantly higher proportion of results favor their hypothesis than disregard it. Overall this book represented a major advance at the time of its original publication and is of continuing importance. The research findings resolve some of the most stubborn research problems in psychotherapy and the training program based on them points the way toward overcoming the shortage of psychotherapists.

Cognition and Psychotherapy M.J. Mahoney, 2013-11-11

For almost three millennia philosophy and its more pragmatic offspring psychology and the cognitive sciences have struggled to understand the complex principles reflected in the patterned operations of the human mind. What is knowledge? How does it relate to what we feel and do? What are the fundamental processes underlying attention, perception, intention, learning, memory, and consciousness? How are thought, feeling, and action related, and what are the practical implications of our current knowledge for the everyday priorities of parenting, education, and counseling? Such meaningful and fascinating questions lie at the heart of contemporary attempts to build a stronger working alliance among the fields of epistemology, theories of knowledge, the cognitive sciences, and psychotherapy. The proliferation and pervasiveness of what some have called cognitivism throughout all quarters of modern psychology represent a phenomenon of paradigmatic proportions. The reemergence of cognitive concepts and perspectives, whether portrayed as revolutionary, reactive, or evolutionary, developmental in nature, marks what may well be the single most formative theme in late twentieth-century psychology. Skeptics of the cognitive movement, if it may be so called, can readily note the necessary limits and liabilities of naive forms of metaphysics and mentalism.
