Emerging Diseases Of Animals:

Emerging Diseases of Animals Corrie Brown, Carole Bolin, 2000 **The Emergence of Zoonotic Diseases** Institute of Medicine, Board on Global Health, Forum on Emerging Infections, 2002-05-09

Zoonotic diseases represent one of the leading causes of illness and death from infectious disease. Defined by the World Health Organization, zoonoses are those diseases and infections that are naturally transmitted between vertebrate animals and man with or without an arthropod intermediate. Worldwide zoonotic diseases have a negative impact on commerce, travel, and economies. In most developing countries, zoonotic diseases are among those diseases that contribute significantly to an already overly burdened public health system. In industrialized nations, zoonotic diseases are of particular concern for at-risk groups such as the elderly, children, childbearing women, and immunocompromised individuals.

The Emergence of Zoonotic Diseases: Understanding the Impact on Animal and Human Health covers a range of topics which include an evaluation of the relative importance of zoonotic diseases against the overall backdrop of emerging infections, research findings related to the current state of our understanding of zoonotic diseases, surveillance and response strategies to detect, prevent, and mitigate the impact of zoonotic diseases on human health, and information about ongoing programs and actions being taken to identify the most important needs in this vital area.

Sustaining Global Surveillance and Response to Emerging Zoonotic Diseases National Research Council, Division on Earth and Life Studies, Board on Agriculture and Natural Resources, Institute of Medicine, Board on Global Health, Committee on Achieving Sustainable Global Capacity for Surveillance and Response to Emerging Diseases of Zoonotic Origin, 2010-01-24

H1N1 swine flu, SARS, mad cow disease, and HIV/AIDS are a few examples of zoonotic diseases transmitted between humans and animals. Zoonotic diseases are a growing concern given multiple factors: their often novel and unpredictable nature, their ability to emerge anywhere and spread rapidly around the globe, and their major economic toll on several disparate industries. Infectious disease surveillance systems are used to detect this threat to human and animal health. By systematically collecting data on the occurrence of infectious diseases in humans and animals, investigators can track the spread of disease and provide an early warning to human and animal health officials nationally and internationally for follow-up and response. Unfortunately, for many reasons, current disease surveillance has been ineffective or untimely in alerting officials to emerging zoonotic diseases.

Sustaining Global Surveillance and Response to Emerging Zoonotic Diseases assesses some of the disease surveillance systems around the world and recommends ways to improve early detection and response. The book presents solutions for improved coordination between human and animal health sectors and among governments and international organizations. Parties seeking to improve the detection and response to zoonotic diseases, including U.S. government and international health policy makers, researchers, epidemiologists, human health clinicians, and veterinarians, can use this book to help curtail the threat zoonotic diseases pose to economies, societies, and health.

Arthropods as Vectors of Emerging Diseases Heinz Mehlhorn, 2012-07-05

Global warming and globalization are the buzzwords of our time They have nearly reached a religious status and those who deny their existence are considered modern heretics Nevertheless the earth has become an overcrowded village traversable within a single day Thus it is hardly surprising that besides persons and goods also agents of disease are easily transported daily from one end of the world to the other threatening the health and lives of billions of humans and their animals Agents of diseases prions viruses bacteria fungi and parasites are not only transmitted by body contact or direct exchange of bodily fluids but also by means of vectors which belong to the groups of licking or blood sucking arthropods mites ticks insects that live close to humans and their houses Without a doubt the recently accelerating globalization supports the import of agents of disease into countries where they never had been or where they had long since been eradicated leading to a false sense of living on a safe island These newly imported or reintroduced diseases called emerging diseases may lead to severe outbreaks in cases where the countries are not prepared to combat them or in cases where viruses are introduced that cannot be controlled by medications or vaccines Arthropods are well known vectors for the spread of diseases Thus their invasion from foreign countries and their spreading close to human dwellings must be blocked everywhere in donor and receptor countries using safe and effective measures This book presents reviews on examples of such arthropod borne emerging diseases that lurk on the fringes of our crowded megacities The following topics show that there is an ongoing invasion of potential vectors and that control measures must be used now in order to avoid disastrous outbreaks of mass diseases
