Emissions Reduction Nox Sox Suppression:

Emissions Reduction A. Tomita, 2001-12-18 Over the past decade the topic of emissions reduction and control has remained an important area of research due to the enforcement of various Government policies in an attempt to minimize the impact on the environment One area in which a great deal of research has been conducted to address this policy is NOx SOx suppression However despite the progress that has been made over this time period further research into the most effective method of reducing NOx SOx emissions is still urgently required In developed countries a more stringent requirement in the level of emissions such as is NOx SOx component of less than 10ppm will be enforced in the near future Developing countries will also need a new technology that is effective and that is suited to each countries needs Additional research and development efforts are thus necessary to meet such requirements This compendium contains a collection of key papers themed around NOx SOx emissions from combustion of hydrocarbon resources and the attempts to secure an efficient and effective method for reducing these emissions These key papers are taken from the journals Fuel Fuel Processing Technology and Progress in Energy and Combustion Science **The John Zink Hamworthy Combustion Handbook** Charles E. Baukal, Jr., 2012-12-13 Despite the length of time it has been around its importance and vast amounts of research combustion is still far from being completely understood Environmental cost and fuel consumption issues add further complexity particularly in the process and power generation industries Dedicated to advancing the art and science of industrial combustion

Integrated Assessment of Sustainable Energy Systems in China, The China Energy Technology Program B. Eliasson, Y. Lee, 2012-12-06 The purpose of the China Energy Technology Program CETP has been to take a holistic view of electricity generation in China with special emphasis on the economic and environmental impact of technology. The program is a collaborative effort involving industry as leader and manager of the program, researchers from academia and national research institutes, and the stakeholders, users or planners of the electricity market. A power plant, no matter of what kind, is not a solitary unit which may be considered independently from its environment. Modern society has been built on easy access to power; it is now asking for environmentally clean power. Clean power is the pathway that will lead to sustainability, an extension of the concept of an environmentally clean future. Progress toward a sustainable technical solution must include an evaluation of the environmental, economic, and societal impact of electrical power generation. To achieve the goals of the CETP program, we wanted to go beyond what had been done in similar programs in the past. Its organizers wanted the program not only to evaluate the overall impact of electricity generation but also to do it in such a way that program results could be applied and adapted to different circumstances, including countries other than China. For this purpose, we have developed a methodology and presented it on a DVD disc which the reader will find inside the back cover of this book. The methodology is conceived to allow insights into the function of the program on various levels.
