Proteomics as a multifaceted tool in medicine and environmental assessment Jacob Kuruvilla, 2017-08-18

Proteomics is evolving as a multi faceted tool for addressing various biochemical and biomedical queries in the field of scientific research This involves various stages ranging from sample preparation to data analysis and biological interpretation Sample preparation involves isolating proteins from the sample source purifying and digesting them to initiate shotgun proteomics Shotgun proteomics identifies proteins by bottom up proteomic approaches where proteins are identified from the fragmentation spectra of their own peptides Paper I deals with the simplification of functional characterization for nanoparticles intended for use in biomedicine Proteomics was constructive in differentiating and semi quantifying the surface of protein corona This could be beneficial in predicting the interactions between nanoparticles and a biological entity like the cell or a receptor protein and provide initial valuable information related to targeting uptake and safety Paper II deals with understanding effects of TiO₂ nanoparticles on endothelial cells A combinatorial approach involving transcriptomics and proteomics was used to identify aberrations in the permeability and integrity of endothelial cells and tissues Our study also investigated the correlation of size and how they motivated a differential cellular response In case of intravenous entry for nanoparticles in targeted drug delivery systems endothelial cells are the first barrier encountered by these drug carriers This evaluation involving endothelial cell response could be very instrumental during the designing of NP based drug delivery systems Paper III Pharmaceuticals and its metabolites could be very hazardous especially if its disposal is not managed properly Since water bodies are the ultimate sink these chemicals could end up there culminating in toxicity and other mixture effects in combination with other factors To evaluate the effects of the pharmaceutical propranolol and climatic factors like low salinity conditions a microcosm exposure was designed and shotgun proteomics helped understand its impact on mussel gills In this study too a combination of transcriptomics and proteomics unveiled molecular mechanisms altered in response to stressors both individually and in combination Paper IV An interplay of various factors like EBF1 and PAX5 determines B cell lineage and commitment This might have been materialized by direct and transient proteinprotein interactions A unique method called BioID helped screen relevant interactions in living cells by the application of a promiscuous biotin ligase enzyme capable of tagging proteins through biotinylation based on a proximity radius Biotinylation of endogenous proteins enabled their selective isolation by exploiting the high affinity of biotin and streptavidin on streptavidin coated agarose beads leading to their identification by mass spectrometry The biotinylated proteins were potential candidate interactors of EBF1 and PAX5 which were later confirmed by sequencing techniques like ChIP Seq ATAC seq and visualization techniques like proximity ligation assay PLA
