Fundamentals of Heat Exchanger Design Ramesh K. Shah,Dusan P. Sekulic,2003-08-11 Comprehensive and unique source integrates the material usually distributed among a half a dozen sources Presents a unified approach to modeling of new designs and develops the skills for complex engineering analysis Provides industrial insight to the applications of the basic theory developed Principles of Solar Gas Turbines for Electricity Generation Amos Madhlopa,2018-05-11 This is the first book dedicated to solar gas turbines providing fundamental knowledge and state of the art developments in the field A gas turbine is a heat engine in which a mixture of fuel and air is burned in a chamber that is an integral part of the flow circuit of the working fluid The burnt gas mixture expands and turns the turbine which can be connected to a generator for electricity production Solar gas turbines offer an important alternative to conventional gas turbines driven by non renewable polluting fossil fuels such as diesel or natural gas The book provides a comprehensive overview of the topic as well as numerous illustrations **Fin-Shape Thermal Optimization Using Bejan's Constuctal Theory** Giulio Lorenzini,Simone Moretti,Alessandra Conti,2022-05-31 The book contains research results obtained by applying Bejan s Constructal Theory to the study and therefore the optimization of fins focusing on T shaped and Y shaped ones Heat transfer from finned surfaces is an example of combined heat transfer natural or forced convection on the external parts of the fin and conducting along the

fin Fin s heat exchange is rather complex because of variation of both temperature along the fin and convective heat transfer coefficient Furthermore possible presence of more fins invested by the same fluid flow has to be considered Classical fin theory tried to reduce the coupled heat transfer problem to a one dimensional problem by defining an average temperature of the fin and writing equations using this parameter However it was shown that this approach cannot be used because of the effects of two dimensional heat transfer especially in the presence of short fins CFD codes offer the possibility to consider bi dimensional and more generally three dimensional effects and then a more real approach to the physic phenomena of finned surface s heat exchange A commercial CFD code was used to analyse the case of heat exchange in presence of T shaped fins following an approach suggested by Bejan s Constructal Theory The comparative results showed a significant agreement with previous research taken as a reference and this result allows for the application of this approach to a wider range of systems T shaped optimized fin geometry is the starting point for further research Starting from the optimal results T shape optimized fins we show the trend of the assessment parameter the dimensionless conductance in function of the angle α between the two horizontal arms of the fin A value for $\alpha = 90^\circ$
