Ehrlichiosis A Vector Borne Disease Of Animals And Humans:

Ehrlichiosis J.C. Williams,I. Kakoma,2012-12-06 This book is a direct result of a symposium held in December 1988 in Washington DC honoring Professor Emeritus Miodrag Ristic for his contributions to rickettsial disease research in general and to ehrlichiosis in particular He and his colleagues in the United States Army Medical Research Unit brought to the world's attention an epidemic of ehrlichiosis that occurred in German shepherd dogs during the Vietnam War The group was able to culture the microorganism Ehrlichia canis and to fulfill Koch's postulates They eventually developed an indirect immunofluorescent antibody IFA test which has been adopted internationally The same group joined a national effort to decipher another mysterious disease known as Potomac horse fever PHF They used the same technology developed by Nyindo in Dr Ristic's laboratory to isolate characterize and again develop a similar IFA test for PHF Today PHF has been diagnosed at least serologically practically across the entire United States in some provinces of Canada and reports are beginning to trickle in of its occurrence in European countries Thus the etiologic agent of PHF now named after Professor Ristic Ehrlichia risticii historically places this scientist side by side with the other 2 R's i.e Ricketts and de Rochalima Ehrlichiosis is not limited to domestic animals Sennetsu rickettsiosis long known by Japanese scientists as an imitator of infectious mononucleosis was subsequently shown to be caused by an ehrlichial agent through collaborative efforts among the United States Army the University of Illinois and Dr Ehrlichiosis: A Vector-Borne Disease of Animals and Humans. Microbe-vector Interactions in Vector-borne Diseases S. H. Gillespie,G. L. Smith,A. Osbourn,2004-05-06 Several billion people are at daily risk of life threatening vector borne diseases such as malaria trypanosomiasis and dengue This volume describes the way in which the causal pathogens of such diseases interact with the vectors that transmit them It details the elegant biological adaptations that have enabled pathogens to live with their vectors and in some circumstances to control them This knowledge has led to novel preventative strategies in the form of antibiotics and new vaccines which are targeted not at the pathogen itself but at its specific vector *Infectious Diseases in Immunocompromised Hosts* Vassil St. Georgiev,1997-12-29 Because of limited access to medical libraries and medical journals the majority of clinicians may find it difficult to keep informed on the latest developments in drug manufacture and treatment of infectious diseases in

immunocompromised patients This new handbook strives to fulfill the need for information in this area of medicine This is the first book on drug development and treatment of infectious diseases in immunocompromised hosts It integrates both results from large scale clinical trials and single cases as well as small groups of patients It covers bacterial viral parasitic and fungal infections including a wide array of diseases Infectious Diseases in Immunocompromised Hosts encompasses not only opportunistic infections associated exclusively with immunocompromised patients but also common infections that become life threatening for immunosuppressed individuals

Emerging zoonoses: eco-epidemiology, involved mechanisms and public health implications Rubén Bueno-Marí, A. Paulo Gouveia Almeida, Juan Carlos Navarro, 2015-07-06 Zoonoses are currently considered as one of the most important threats for public health worldwide Zoonoses can be defined as any disease or infection that is naturally transmissible from vertebrate or invertebrate animals to humans and vice versa Approximately 75% of recently emerging infectious diseases affecting humans are diseases of animal origin approximately 60% of all human pathogens are zoonotic All types of potential pathogenic agents including viruses parasites bacteria and fungi can cause these zoonotic infections From the wide range of potential vectors of zoonoses insects are probably those of major significance due to their abundance high plasticity and adaptability to different kinds of pathogens high degrees of synanthropism in several groups and difficulties to apply effective programs of population control Although ticks flies cockroaches bugs and fleas are excellent insects capable to transmit viruses parasites and bacteria undoubtedly mosquitoes are the most important disease vectors Mosquito borne diseases like malaria dengue equine encephalitis West Nile Mayaro or Chikungunya are zoonoses with increasing incidence in last years in tropical and temperate countries Vertebrates can also transmit serious zoonoses highlighting the role of some carnivorous animals in rabies dissemination or the spread of rodent borne diseases in several rural and urban areas Moreover the significance of other food borne zoonoses such as taeniasis trichinellosis or toxoplasmosis may not been underestimated According to WHO FAO and OIE guidelines an emerging zoonotic disease can be defined as a zoonosis that is newly recognized or newly evolved or that has occurred previously but shows an increase of incidence or expansion in geographical host or vector range There are many factors that can provoke or accelerate the emergence of zoonoses such as environmental changes habitat modifications variations of human and animal demography pathogens and vectors anomalous mobilization related with human practices and globalization deterioration of the strategies of vector control or changes in pathogen genetics To reduce public health risks from zoonoses is absolutely necessary to acquire an integrative perspective that includes the study of the complexity of interactions among humans animals and environment in order to be able to fight against these issues of primary interest for human health In any case although zoonoses represent significant public health threats many of them still remain as neglected diseases and consequently are not prioritized by some health international organisms

Handbook of Zoonoses, Second Edition George W. diseases that are host specific and reviews the effects of various human diseases on animals Discussions address diseases that remain important public and animal health problems and the techniques that can control and prevent them The chapters are written by internationally recognized scientists in their respective areas of disease who work or have worked extensively in the most affected areas of the world The emphasis for each zoonosis is on the epidemiology of the disease the clinical syndromes and carrier states in infected animals and humans and the most current methods for diagnosis and approaches to control For infectious agents or biologic toxins which may be transmitted by foods of animal origin a strong focus is placed on food safety measures The etiologic and therapeutic aspects of each disease important to epidemiology and control are identified
