Biomaterials for Surgical Operation Shuko Suzuki, Yoshito Ikada, 2011-12-21 Biomaterials for Surgical Operation offers a review of the latest advances made in developing bioabsorbable devices for surgical operations which include surgical adhesives sealants barriers for the prevention of tissue adhesion polymers for fractured bone fixation growth factors for the promotion of wound healing and sutures Over the years many descriptions of biomaterials have appeared in academic journals and books but most of them have been devoted to limited clinical areas This is in marked contrast with this volume which covers a wide range of bioabsorbable devices used in surgery from a practical point of view The currently applied polymeric devices are critical in surgery but all involve serious problems due to their poor performance For instance fibrin glue the most widely used surgical sealant can produce only a weak gel with low adhesive strength to tissues accentuating the limited effectiveness of current treatment options Likewise the currently available barrier membranes cannot fully prevent tissue adhesion at the acceptable level and are moreover not easy to handle with endoscopes due to their poor mechanical properties Biomaterials for Surgical Operation is aimed at those who are interested in expanding their knowledge of how the problems associated with the currently used devices for surgical

operation can be solved It primarily focuses on the absorbable biomaterials which are the main components of these medical devices Yearbook of Intensive Care and Emergency Medicine 2001 Prof. Jean-Louis Vincent,2013-11-11 The yearbook compiles the most recent widespread developments of experimental and clinical research and practice in one comprehensive reference book The chapters are written by well recognized experts in the field of intensive care and emergency medicine It is addressed to everyone involved in internal medicine anesthesia surgery pediatrics intensive care and emergency medicine
