Gilchrist, 2010-12-10 G protein coupled receptors GPCRs are a large protein family of transmembrane receptors vital in dictating cellular responses GPCRs are involved in many diseases but are also the target of around half of all modern medicinal drugs Shifting Paradigms in G Protein Coupled Receptors takes a look at the way GPCRs are examined today how

they react how their mutations lead to disease and the many ways in which they can be screened for compounds that modulate them Chemists pharmacologists and biologists will find essential information in this comprehensive reference

GnRH: The Master Molecule of Reproduction Andrea C. Gore, 2013-03-09 Gonadotropin releasing hormone GnRH cells are the key regulators of reproductive function in all vertebrate organisms The GnRH molecule is synthesized in a small number of neurons in rostral hypothalamic regions of the brain In mammals these neurons release the GnRH decapeptide into the portal capillary system leading to the anterior pituitary gland There GnRH causes the release of the gonadotropins luteinizing hormone LH and follicle stimulating hormone FSH which in turn act upon the gonads to stimulate their maturation and to cause synthesis of sex steroid hormones estrogen progesterone and testosterone Although each of the levels of the hypothalamic pituitary gonadal axis is critical for reproductive function GnRH neurons play the primary role in the control of reproductive maturation and adult reproductive function and may even play a role in reproductive senescence Since its discovery in 1970 there has been intense interest in GnRH producing neurons with more than 8000 papers and chapters in the last decade alone Despite this activity of research in basic and clinical science there has never been a book written specifically on GnRH neurons GnRH The Master Molecule of Reproduction aims to bring together the large and diverse literature of both laboratory and applied research that focuses on these unique cells This book will provide basic background into reproductive neuroendocrinology as well as specifics regarding the role of GnRH neurons in the control of reproduction Students studying endocrinology reproduction neuroendocrinology or molecular endocrinology will benefit from this book In addition this book will take a multi species approach which will be useful both to basic researchers as well as clinicians Whenever possible species differences and similarities will be presented and if possible studies on humans or the clinical relevance of basic research findings to humans will be discussed such as the treatment of reproductive disorders such as abnormalities in pubertal development or infertility

Molecular Basis of Reproductive Endocrinology Peter C.K. Leung,Aaron J.W. Hsueh, Henry G. Friesen,2012-12-06 Recent advances in molecular biology have provided new dimensions in the study of the reproductive system There has been major progress in our understanding of the molecular mechanisms of hormone action in the past few years The symposium on Molecular Basis of Reproductive Endocrinology was organized to highlight new research findings on the regulation of the hypothalamic pituitary gonadal axis The emphasis of the symposium was on physiological questions answered by the molecular biology approach Studies on the functional relevance of gonadotropin releasing hormone and LH and FSH gene expression were presented together with research on the molecular biology of ovarian and testicular steroidogenic enzymes and protein hormones Also several novel aspects of hormone gene expression in placental tissues were reviewed The symposium was held July 25 to 26 1991 immediately prior to the 24th Annual Meeting of the Society for the Study of Reproduction on the campus of the University of British Columbia in Vancouver Serono Symposia USA generously financed and coordinated the meeting We are indebted to Dr Bruce K Burnett and Dr L Lisa Kern for their professional assistance in the organization of the symposium We would also like to thank Drs Victor Gomel Basil Ho Yuen and John Challis who served as session moderators Most of all we truly appreciate the efforts of all the invited speakers poster presenters and discussants in making this a memorable event as the largest one day meeting of the Serono Symposia USA series

Molecular Modeling and Prediction of Bioactivity Klaus Gundertofte,Fleming Steen Jørgensen,2012-12-06 Much of chemistry molecular biology and drug design are centered around the relationships between chemical structure and measured properties of compounds and polymers such as viscosity acidity solubility toxicity enzyme binding and membrane penetration For any set of compounds these relationships are by necessity complicated particularly when the properties are of biological nature To investigate and utilize such complicated relationships henceforth abbreviated SAR for structure activity relationships and QSAR for quantitative SAR we need a description of the variation in chemical structure of relevant compounds and biological targets good measures of the biological properties and of course an ability to synthesize compounds of interest In addition we need reasonable ways to construct and express the relationships i e mathematical or other models as well as ways to select the compounds to be investigated so that the resulting QSAR indeed is informative and useful for the stated purposes In the present context these purposes typically are the conceptual understanding of the SAR and the ability to propose new compounds with improved property profiles Here we discuss the two latter parts of the

SAR/QSAR problem i.e. reasonable ways to model the relationships and how to select compounds to make the models as good as possible. The second is often called the problem of statistical experimental design which in the present context we call statistical molecular design. SMD 1

Pharmacology of G Protein Coupled Receptors, 2011-09-08 G protein coupled receptors remain the most important class of therapeutic targets in medicine. In the last 5 years tremendous advances have been made in our understanding of the structure and mechanism of this critical family of drug targets. The present volume explores the modern experimental and conceptual framework for drug discovery for G protein coupled receptors. It explores advances in structure determination and structure based drug design as well as new concepts of allosteric modulation, functional selectivity, biased agonism and pharmacological chaperones. In addition emerging drug targets such as receptor families for fatty acids, carboxylic acids, lipid mediators etc. are included. Final chapters cover novel mechanisms of signal regulation through PDZ domains and RGS proteins. This volume will bring an up to date perspective on the G protein coupled receptor field to both academic and industry scientists. Advances in Molecular and Cellular Endocrinology D. LeRoith, 1997-03-25 Historically the field of endocrine research has always been at the forefront of scientific endeavors. The investigators of these important breakthroughs in research have been rewarded by numerous Nobel awards. In the field of diabetes alone Nobel prizes have been awarded to researchers who discovered insulin, characterized the protein and invented radioimmunoassays using insulin as a paradigm. Not surprisingly biomedical researchers have always been attracted by the endocrine system and other similar systems of intercellular communication. Over the past two decades endocrine research has developed rapidly and adapted modern molecular and cellular biology techniques for its specific use. These changes have allowed researchers in the field to maintain their edge. Thus endocrine disease related genes have been characterized and mutations in these genes have helped explain common and less common endocrine disorders. Our understanding of the regulation of gene expression has been greatly enhanced by molecular techniques. In an attempt to bring investigators up to date with the recent advances in this exploding field we have decided to publish a series entitled *Advances in Molecular and Cellular Endocrinology*. Internationally famous investigators have agreed to participate and their contributions are appreciated. Volume 1 has focused on aspects of the hypothalamic-pituitary axis including GnRH and GH gene regulation, molecular aspects of insulin, insulin-like growth factors and glucagon. In addition reviews on the recently cloned calcium receptor and steroid receptor interactions with DNA are presented.
