

## Background

Electricity supply constraints (load shedding), together with increasing electricity tariffs and decreasing prices of renewable energy technologies, have driven the substantial uptake of **Embedded Generation (EG)** in South Africa.

According to analyses by Eskom and the evaluation of satellite images published by the South African Photovoltaics Industry Association (SAPVIA), nearly 4.9 GW of behind the meter generation (mainly PV) is operational in South Africa.

While this fivefold increase within 18 months is to a large extent a response to load shedding, embedded generation is a viable option for an increasing number of customers segments and consequently, the market will continue to grow.

Generally most utility-scale renewable generators are connected to Eskom's grid, whereas the majority of commercial, industrial and residential embedded generation is connected to municipal distribution networks.

## Field of Intervention:

# Embedded Generation

Every roof can deliver clean energy, every distribution network should integrate it

## Challenges

The unprecedented uptake of embedded generation – mainly rooftop solar photovoltaic (PV) – has significant implications for network service providers, in terms of financial, technical and safety impacts.

For example, the loss in revenue caused by customers generating part of their own electricity demand is contributing to the financial distress of municipalities.

Systems connected to the grid not adhering to codes and standards can pose a safety hazard to municipal staff working on lines. Knowledge about the capacity and location of embedded generators is an essential input variable for network expansion considerations.

Since the embedded generation market will continue to grow, municipalities should encourage and incentivise customers and operators to register their systems and adhere to all codes, standards and policies.

The challenges can have far adverse effects if these systems are not registered, and municipalities do not know where they are located on the distribution network.

*Distributed Generation* Dattatraya Gaonkar,2010-02-01 In the recent years the electrical power utilities have undergone rapid restructuring process worldwide Indeed with deregulation advancement in technologies and concern about the environmental impacts competition is particularly fostered in the generation side thus allowing increased interconnection of generating units to the utility networks These generating sources are called distributed generators DG and defined as the plant which is directly connected to distribution network and is not centrally planned and dispatched These are also called embedded or dispersed generation units The rating of the DG systems can vary between few kW to as high as 100 MW

Various new types of distributed generator systems such as microturbines and fuel cells in addition to the more traditional solar and wind power are creating significant new opportunities for the integration of diverse DG systems to the utility. Interconnection of these generators will offer a number of benefits such as improved reliability, power quality, efficiency, alleviation of system constraints along with the environmental benefits. Unlike centralized power plants, the DG units are directly connected to the distribution system, most often at the customer end. The existing distribution networks are designed and operated in radial configuration with unidirectional power flow from centralized generating station to customers. The increase in interconnection of DG to utility networks can lead to reverse power flow, violating fundamental assumption in their design. This creates complexity in operation and control of existing distribution networks and offers many technical challenges for successful introduction of DG systems. Some of the technical issues are islanding of DG, voltage regulation, protection, and stability of the network. Some of the solutions to these problems include designing standard interface control for individual DG systems by taking care of their diverse characteristics, finding new ways to install and control these DG systems, and finding new design for distribution system. DG has much potential to improve distribution system performance. The use of DG strongly contributes to a clean, reliable, and cost-effective energy for future. This book deals with several aspects of the DG systems such as benefits, issues, technology, interconnected operation, performance, studies, planning, and design. Several authors have contributed to this book, aiming to benefit students, researchers, academics, policy makers, and professionals. We are indebted to all the people who either directly or indirectly contributed towards the publication of this book.

*Power Quality Indices in Liberalized Markets* Pierluigi Caramia, Guido Carpinelli, Paola Verde, 2009-08-06. Power Quality (PQ) indices are a powerful tool for quickly quantifying PQ disturbances. They also serve as the basis for illustrating the negative impact of electrical disturbances on components and for assessing compliance with the required standards and recommendations within a regulating framework. Within these pages lies a comprehensive overview of both the traditional PQ indices in use today and new indices likely to be used in the future. Key features of this book include a special focus on the metrics for quantifying PQ disturbances, a complete review of methods and indices for assessing disturbance responsibilities between customers and utilities, a survey on PQ objectives around the world with highlights on the economic aspects of PQ disturbances. Inside you will find a thorough and well-balanced treatment on theoretical concepts and practical applications enhanced by examples and exercises of PQ indices computation and use. This is an important resource for academics, students of power quality, reliability, and electrical power systems courses, and also for practicing engineers involved in solving PQ problems in the new structures of liberalised energy markets.
