Freeze Thaw Durability Of Concrete:

Freeze-Thaw Durability of Concrete J. Marchand, M. Pigeon, M.J. Setzer, 1996-12-19 Concrete durability in climates where freezing and thawing occurs is a continuing problem It is particularly acute for highway and bridge structures where de icing salts are used to combat the effects of frost snow and ice These salts can cause damage to concrete and accelerate corrosion of reinforcements This book presents the latest international research on this area with contributions from North America and Europe which were presented at an international RILEM workshop

Freeze-thaw Durability of Concretes with and Without Class C Fly Ash Chengsheng Ouyang, John Lane, 1997 The freeze thaw resistance of concretes was studied Nine concrete mixes made with five cements and cement Class C fly ash combinations were exposed to freeze thaw cycling following 110 to 222 days of moist curing Prior to the freeze thaw cycling the specimens were examined by a low vacuum scanning electron microscope SEN for their microstructure The influence of a wet dry treatment was also studied Infilling of ettringite in entrained air voids was observed in the concretes tested The extent of the infilling depends on the period of moist curing as well as the wet dry treatment The concretes with 15% Class C fly ash replacement show more infilling in their air voids It was found that the influence of the infilling on the freeze thaw durability relates to the air spacing factor The greater the spacing factor the more expansion under the freeze thaw cycling The infilling seems to decrease effective air content and to increase effective spacing factor The infilling also implies that the filled air voids are water accessible These might lead to concrete more vulnerable to the freeze thaw attack By combining the above results with field observations one may conclude that the freeze thaw damage is a factor related to premature deterioration of PCC pavements in Iowa

Freeze-thaw Durability of Concrete with Natural and Recycled Concrete Aggregates Using Air Entraining Admixture Salman Sulaiman, 2016 Freezing and thawing cycles is one of the most damaging factors that affect the durability of concrete The damages caused by the cyclic freeze thaw action can be divided into two factors The first factor is an increase in internal crack which causes the loss in relative dynamic modulus RDM of the concrete and the second factor is surface scaling which leads to weight loss of the concrete In this study the durability of

concrete made by replacing natural coarse aggregates NCA with various percentages of recycled concrete aggregates RCA. Also some tests have been conducted with the addition of air entraining admixture AEA. Prior to mixing the concrete both NCA and RCA were characterized to determine their suitability as a construction material. Concrete mixes consisting of 0, 20, 40, 60, 80 and 100% replacement by weight of NCA with RCA were prepared. The same concrete mixes were prepared again but with the addition of an air entraining admixture AEA. All specimens were tested for compressive strength after a curing period of 7, 14 and 28 days. The compressive strength of the concrete made with different percentage of RCA decreases as the percentage of RCA increases. After 28 days of curing samples with 0, 40 and 100% replacement of NCA with RCA were placed in the freeze thaw chamber along with 0, 20, 40, 60, 80 and 100% NCA replacement containing AEA. After several cycles of freezing and thawing the RDM change in weight and change in length were measured. In this study loss of RDM and weight loss were noticed as the cyclic freeze thaw increases. It has also been observed that concrete mixes containing AEA were still durable after 300 cycles of freezing and thawing however the specimens without AEA failed before 150 cycles.

Freeze-thaw Durability of Concrete with and Without Silica Fume in ASTM C 666 (procedure A) Test Method, 1987. **INFLUENCE OF AIR-VOID SYSTEM ON FREEZE-THAW DURABILITY OF CONCRETE.** ZAFAR AHMED. MALIK, 1991. Two way analysis of variance showed that type of air entraining agent, quality of aggregate and content of condensed silica fume have a major effect on freeze thaw durability of concrete. Freeze-thaw Durability of Concretes with Infilling of Ettringite in Voids Chengsheng Ouyang, O. J. Lane, 1997. Examination of field portland cement concrete cores from Iowa pavements with premature deterioration reveals extensive infilling of calcium sulfate aluminum CSA compound in their air voids. A previous study Phase I has shown some evidence of the correlation between freeze thaw durability of concretes and ettringite infilling. To further verify the previous observation a more extensive experimental program was conducted in this Phase 2 study. A total of 101 concrete mixes were examined. Seven cements, six fly ashes, two water reducers and three coarse aggregates were used in the concrete mixes. Specimens were under moist curing for up to 233 days before being subjected to the freeze thaw cycling. An environmental treatment consisting of three consecutive wet 70 F in distilled water, dry 120 F in oven cycles was applied to some specimens. Immediately prior to the freeze thaw cycling most specimens were examined by a low vacuum scanning electron microscope SEM for their microstructure. The results obtained further demonstrate the correlation between concrete freeze thaw response and CSA compound infilling in the air voids. The extent of the infilling depends on the period of moist curing as well as the wet dry treatment. The extent of the infilling also relates to materials used. Concrete mixes with extensive infilling are more vulnerable to the freeze thaw attack. Based on the obtained results material criteria on cements and fly ashes for mainline paving were proposed for minimizing potential infilling of CSA compound in concrete. *Tests for Freeze-thaw Durability of Concrete Aggregates* California.
