pharmaceuticals hormones industrial chemicals detergents cyanotoxins and nanomaterials High concentrations of antimicrobial agents have been found worldwide originating from inadequately treated household wastewater livestock and aquaculture Biological treatment technology for water pollution uses microorganisms to break down pollutants into harmless or less toxic substances becoming an important means of addressing water pollution Its advantages lie in low cost adaptability and the ability to effectively treat various organic pollutants including hydrocarbons pharmaceuticals and pesticides However the effectiveness of this technology depends on the selection of appropriate microbial strains and the optimization of treatment conditions such as temperature pH and nutrients In the aspect of water pollution analysis accurate detection of the types and concentrations of pollutants is a prerequisite for management and remediation Modern instruments such as gas chromatography mass spectrometry GC MS and liquid chromatography mass spectrometry LC MS can identify and quantify trace pollutants in complex water bodies Additionally new generation sensing technologies and biological detection tools like DNA microarrays and gene sequencing technologies enable rapid detection of specific pollutants and reveal microbial community responses to pollutants These technologies can effectively target and treat heavy industrial and chemical pollution thereby protecting water environmental safety This book aims to facilitate the exchange of scientific information among scholars from leading universities research centers and high tech enterprises around the world This book is highly beneficial to scholars engineers and researchers in the fields of environmental engineering and water pollution
