Productive public investment in agriculture for economic recovery with rural well-being: an analysis of prospective scenarios for Uganda Sánchez, M.V., Cicowiez, M., Pereira Fontes, F.,2022-02-21 This study highlights how through a series of scenarios public investments promoting agricultural productivity in Uganda could drive growth in agrifood production with favourable impacts on the economy on well being and on poverty especially in rural areas Using a modelling tool to represent the Ugandan economy with its multiple sectors and current fiscal constraints the study ranked the subsectors of Uganda s agriculture that through the productivity impact of public investments representing 0.25 percent of GDP on average about 373 billion 2017 Uganda shillings during the years 2023-2025 will generate the greatest socio economic benefits maximizing the cost effectiveness of the public investments Generally economic growth and the welfare of households as measured by their consumption will be positively impacted but the impacts will ultimately depend on the sector that receives the investment which is shown in a ranking The agricultural sectors targeted for government investment will increase their output and food prices will thus fall and this will stimulate growth in non agricultural sectors both by increasing final demand for non agricultural products and by lowering input prices and fostering upstream processing Lower food prices will have a significant impact since food represents a relatively large proportion of the consumption basket of poorest households Furthermore labour income for rural households will increase with productivity growth and this will reduce rural poverty The findings of this study provide important information about the priorities of Uganda s National Development Plan NDP III and vision for agriculture as well as new priorities to be considered for enabling economic recovery with increased well being post COVID 19

underperformance Bank lending has been subdued as well but this appears to have only held back the recovery relatively moderately A 10 percent increase in bank credit to the private sector is associated with a rise of 0.61 percent in real GDP and 2.212 percent in real private investment These relationships have not changed significantly during and after the GFC Loan quality customer deposits bank equity price index and bank capital appear to be closely linked to bank lending As expected bank profitability is positively and significantly influenced by credit growth but this relationship has weakened after the GFC
