Geophysical Use Of Satellite Beacon Symp:

Air Force Surveys in Geophysics ,1975 **Adaptive Mapping of Mid-latitude Ionosphere** Richard S. Allen,1977

Maps of the monthly median of refractive effects are used by precision navigation and radar systems to correct for measurement errors caused by the ionosphere Calculated off line using available climatologies of the pertinent ionospheric parameters they are used in real time systems to remove 70 to 75 percent of the monthly rms error When greater precision is required these maps may be adapted by any of several local measurements of current ionospheric conditions The residual refractive error is dependent on the density of these local measurements in space and time and on their ability to characterize the current ionosphere Systematic variations of the ionosphere are usefully predicted over a few hours Local features that have large geophysical scale size such as the nighttime trough and the plasmapause enhancement of the mid latitude ionosphere are tracked by sequential measurements and may be mapped in space and local time across the entire system field of view during quiet geophysical periods During disturbed periods however their dynamic behavior may require more frequent specifications and in addition very large features can develop which are sharply confined to small areas of the coverage region *Considerations Relative to Adapting TRANSIT Observations to Predicting Radar Range Correction* Allen, Richard S.,1977 Uncertainties in the output data of SPACE TRACK radars caused by the variability of the ionosphere may be reduced 25 to 50 percent through the use of predictions of monthly median effects supplied by AWS GWC For some ADCOM missions this degree of correction is inadequate and a further reduction in error is necessary This may be gained by using local measurements of ionospheric parameters such as total electron content which may be obtained from TRANSIT satellite passes to adapt the model ionosphere An algorithm is proposed which uses data from sequential TRANSIT passes over a limited portion of the field of view of each ADCOM radar to adapt the AWS GWC prediction for the entire field of view From the available TRANSIT data it is estimated that the rms refraction error may be reduced by a factor of 3 to 4 by this technique The principle problem which must be addressed by an adaptive technique is the inherent temporal and spatial variability of the ionosphere The expected day to day variability is about 20 to 25 percent of the monthly median over a solar cycle for stations from the equator to auroral latitudes In using TRANSIT data to adapt a local estimate of the ionospheric refraction correction it is suggested that 1 The adaptive techniques proposed using TRANSIT data should be tested against archive data 2 Techniques using other sensors of the ionosphere such as measurements of total electron content to synchronous satellites should be developed and tested against archive data and the results should be compared with the technique using TRANSIT data before a final method of correction is adapted Author The Orbiting Geophysical Observatories John E.
