Composition and Temperature Effects on Aluminoborosilicate Glasses Structure and Properties Jingshi Wu, 2011 This work studies the effects of compositional and temperature variations on the structure and properties of aluminoborosilicate glasses Two groups of aluminoborosilicate glasses one that has lower boron content and another that has higher boron content have been studied The structural changes were mainly observed with high field ^{11}B and ^{23}Na magic angle spinning MAS nuclear magnetic resonance NMR spectroscopy In these glasses boron is either three coordinate BO_3 or four coordinate BO_4 aluminum exists predominately as four coordinate species but there is a small amount of five coordinate aluminum 5Al The compositional study focused on the effect of the cation field strength of the network modifiers on the glass structure by varying the ratio of the two network modifiers CaO and Na_2O Increasing the ratio of CaO to Na_2O dramatically lowers the fraction of four coordinated boron N_4 increases 5Al and increases the fraction of non bridging oxygens NBO which was calculated based on the boron and aluminum structural information However variations in these fractions are not linear with respect to the average cation field strength ^{23}Na spectra reveal that the ratio of bridging to non bridging oxygens in the coordination shell of Na increases with an increasing ratio of CaO to Na_2O in Ca rich glasses These changes can be understood by the tendency of higher field strength modifier cations to facilitate the concentration of negative charges on NBO in their local coordination environment systematically converting BO_4 to BO_3 The effect of temperature on the structure was studied by two ways cooling the glass forming melts at different rates to sample the glass structure at different fictive temperature and using high temperature in situ NMR The abundances of BO_3 and NBO increase with increasing fictive temperature suggesting that the reaction $\text{BO}_4 \rightarrow \text{BO}_3 + \text{NBO}$ shifts to the right with increasing temperature The observed temperature dependence of the abundance of BO_4 species allows us to estimate the enthalpy of reaction ΔH which is closely related to the amount of NBO in the glass In situ high T ^{11}B MAS NMR was used to observe chemical exchange between BO_3 and BO_4 species over the timescale of microseconds to seconds The timescale of BO_3/BO_4 exchange from NMR data lowercase τ_{NMR} appears to be decoupled from that of the macroscopic shear relaxation process lowercase τ_s derived from the viscosity data however at higher temperatures lowercase τ_s approaches lowercase τ_{NMR} The decoupling at lower temperature may be related to intermediate range compositional heterogeneities and/or fast modifier cation diffusivities which trigger unsuccessful network exchange events
