Bliault,Johnny Doo,2009-12-03 In the last half century high speed water transportation has developed rapidly Novel high  
performance marine vehicles such as the air cushion vehicle ACV surface effect ship SES high speed monohull craft MHC  
catamaran CAT hydrofoil craft HYC wave piercing craft WPC and small water area twin hull craft SWATH have all developed  
as concepts achieving varying degrees of commercial and military success Prototype ACV and SES have achieved speeds of  
100 knots in at calm con tions however the normal cruising speed for commercial operations has remained around 35 50  
knots This is partly due to increased drag in an average coastal s way where such craft operate services and partly due to  
limitations of the propulsion systems for such craft Water jets and water propellers face limitations due to c itation at high  
speed for example SWATH are designed for reduced motions in a seaway but the hull form is not a low drag form suitable for  
high speed operation So that seems to lead to a problem maintain water contact and either water propulsion systems run out  
of power or craft motions and speed loss are a problem in higher seastates The only way to higher speed would appear to be  
to disconnect completely from the water surface You the reader might respond with a question about racing hydroplanes  
which manage speeds of above 200 kph Yes true but the power to weight ratio is extremely high on such racing machines  
and not economic if translated into a useful commercial vessel 41' UTB Operator's Handbook ,1986 *Unsinkable* Aaron
